What should we do when we are faced with this situation? Comrade Lin Ruo pointed out: Ours is a planned commodity economy. It is unimaginable that the socialist economy can work without plans. Therefore, management must be strengthened after agricultural production is further decontrolled. It is necessary to "strictly exercise macroeconomic control, and decontrol and enliven microeconomic activities." It is necessary to employ various economic means, or economic levers, as well as necessary administrative means, to strengthen macroeconomic control. Otherwise, there may be a tendency to merely seek immediate economic benefits to the neglect of grain production. Some peasants said: "contracts should be something that I will sign only when I agree." This means that if they do not want to produce as much grain as the state plan requires, they may refuse to sign the contracts. To solve this problem, last year, we adopted a flexible method which was called "receiving grain or an equivalent amount of money." According to this method, peasants are persuaded through our political and ideological work to accept the contract terms on a voluntary basis. Then, they have the right to choose their production items. If they cannot fulfill their grain contracts because they shift too much resources to grow cash crops, they will have to pay an amount of money to buy grain from the markets to make up for the deficiency, and they can also pay this money direct to the state grain department as a compensation. Thus, peasants will have to consider carefully how much resources should be shifted to the production of cash crops and consider whether the shift of production is favorable and profitable. At present, this method can stabilize grain production and ensure the planned development of the rural economy.

Lin Ruo told this reporter: In order to guarantee grain production in the whole province, the sowing area of grain crops will be stabilized at the current level in the next few years (at least at the next 2 years). At the same time, efforts will be made to raise unit yield so as to maintain the province's total grain output at a level above 38 billion jin. The deficiency of grain supply will be made up for by buying grain from other provinces. That is to say, a balance will be maintained between the production, supply, and demand of grain. Various measures will be adopted to protect peasants' enthusiasm for growing grain crops. Recently, the provincial grain department is studying a scheme to reduce the grain production tasks in poor areas. In addition, as the grain price is not now attractive enough, the purchase target for major grain production areas can be appropriately reduced and low-price fertilizer can be supplied to the grain production contractors. In short, measures will be taken to coordinate grain production in different types of areas and to protect peasants' enthusiasm for grain production.

Guangdong's strategy for future development is to stabilize the overall situation, make minor readjustments, and concentrate on building an extensive and intensive rural production structure.

When this reporter asked about the development strategy for readjusting the rural production structure in Guangdong, Comrade Lin Ruo said: We have worked out a general guideline; that is, to stabilize the overall situation, continue to make minor readjustments, and concentrate on building an extensive and intensive rural production structure. Most areas in the province have appropriately readjusted their production structures, and only a small number of areas has not made adequate readjustments or has made excessive readjustments. The overall situation shows that the production structure has been readjusted to an appropriate degree. It is estimated that 70 percent of localities have achieved a proper production structure. A small percentage of localities have made excessive changes, and they will be required to backtrack a little bit; the other small number of localities have not made adequate readjustments, and further minor readjustments will be made there. This is the content of the general strategy of "stabilizing the overall situation and making minor readjustments."

Finally, Comrade Lin Ruo said: We should look at the rural production structural readjustment from a wider angle. This readjustment is not limited in the reduction in the area of paddy fields or in the proportion of grain crops to cash crops. The readjustment should also include the overall utilization of all land and resources as a whole and the regulation of the distribution of primary, secondary, and tertiary industries. Comrade Hu Yaobang said during his recent inspection of Guangdong: Fields, lands, mountains, and water should all be fully and properly utilized; all waste mountains, hillsides, and beaches should be opened for production purposes and can be used to develop forestry, fruit planting, animal husbandry, and aquaculture. Secondary and tertiary industries should also be developed in the countryside. In short, we should not limit our production readjustment to the issue of shifting part of the paddy fields to grow cash crops; instead, we should pay attention to widening our production scope and intensifying our production. We have great potential to tap in this regard. In particular, the vast mountainous areas will be able to achieve remarkable results as they have rich untapped resources.

HENAN BANKS CONTROL FUNDS FOR CONSTRUCTION PROJECTS

HK280928 Zhengzhou Henan Provincial Service in Mandarin 2200 GMT 26 May 86

[Text] Construction banks at all levels throughout the province must strengthen the management of funds for large and medium-sized construction projects really guarantee the funds for key construction projects, and raise investment results. This demand was put forward by the work conference of the provincial construction banks on the management of funds for large and medium-sized construction projects that concluded in Pingdingshan on 25 May.

Proceeding from realities, construction banks at all levels must strictly carry out the plans and management, control the scale of capital construction, rationally provide funds, help the construction projects do well in financial management, and strengthen supervision over spending funds on large and medium-sized projects. At the same time, they must make budgetary estimate of the funds, work out plans for the progress of the projects, and calculate and analyze economic results after the projects are put into operation so as to recover the loans on schedule.

Construction banks must also help the construction units vigorously implement the system of contracted responsibilities for investment and help relevant departments implement the system of inviting tenders for the construction of projects by contract. They must actively participate in the feasibility study of the large and medium-sized projects and provide reliable basis for formulating the policy decisions on the projects.

TALKS HELD ON JIANGSU SUPPORT OF GUANXI COUNTERPARTS

HK121450 Nanning Guangxi Regional Service in Mandarin 1000 GMT 8 May 86

[Excerpts] Thirteen days of talks on Jiangsu supporting Guangxi counterparts recently concluded in Guilin. During the talks, the Jiangsu representatives conducted investigations in and visited 13 prefectures and cities in Guangxi whose counterparts would be supported, and 167 items regarding supporting counterparts and cooperation this year and 99 proposed tasks were decided through consultation. This year the number of items decided through consultation is the largest ever. Furthermore, a new breakthrough in contents and forms has been made. The forms include joint operations, compensation trade, setting up exhibitions in each other's areas, and exchanging products. For the past 6 years and more, with both sides' efforts, Jiangsu and Guangxi have completed some 600 items of supporting counterparts. During the talks, both sides discussed the problems of how to continuously do well in supporting counterparts and how to develop lateral economic ties in the future. The main aspects are as follows:

1. Trades and enterprises in the province and region should extensively support and cooperate with the counterparts in each other's area at many levels, through many channels, and in many forms. Particularly in the fields of light industry, textile industry, chemical industry, electronics industry, machine-building industry, metallurgical industry, and building materials industry, it is essential to carry out effective cooperation such as vigorously effecting the transfer of technology and providing technological services. It is imperative to help Guangxi's existing enterprises enhance their technological and management levels.

2. In the aspect of training and resources, with Jiangxu continuing to train education, public health, professional, and technical personnel for Guangxi, it must also send management and technical personnel and skillful craftsmen, including some retirees, to Guangxi to give specific guidance and assistance. Guangxi will send some cadres at various posts to Jiangsu to study with their counterparts for a specified period of time.

3. Guangxi abounds in natural resources, including mineral products, hydroelectricity, and subtropical crops, while the processing industry in Jiangsu is more developed. There are brilliant prospects for developing lateral economic ties.

4. Both sides will make full use of each other's ports to jointly develop shipping.

5. Regarding the profits made from the items in which Jiangsu supports Guangxi, such as contracts for providing technological services or helping enterprises enhance technical and management levels, both sides will share the profits or Guangxi will pay a lump sum in charges for providing technological services or for transferring technology. All economic trades set up in Guangxi solely with Jiangsu capital or set up in Guangxi jointly by Jiangsu and Guangxi can enjoy preferential treatment whereby the income tax can be reduced by a half for 5 years as well as the preferential treatment for a minority-nationality region. The problem of investment in fixed assets will be solved by Guangxi.

WUXI CITY OFFICIAL HAILS RURAL-URBAN COOPERATION

OW301807 Beijing XINHUA in English 1539 GMT 30 May 86

[Text] Wuxi, May 30 (XINHUA)--Rural-urban cooperation can dramatically improve a city's economic performance, a ranking official of Wuxi, a thriving city in Jiangsu Province in eastern China, said today.

Chang Gensheng, vice-chairman of the city's economic commission, told participants in a symposium here on Asian-Pacific development a third of Wuxi's 9,000 rural industrial enterprises had formed cooperative links with larger urban factories or research or higher education units.

"This has spurred rural development," he said. "It's the best of both worlds: rural enterprises gain from their connection to the scale and advanced research of the city, urban enterprises find factories for small parts assembly tasks, and the commodity economy of the city is enhanced."

The cooperation provies especially beneficial when the city's commercial and export-oriented enterprises become involved, said Chang. He estimated that 95 percent of Wuxi's enterprises--all state or collectively owned--regulate production according to perceptions of market demand.

For that reason, he said, "rural enterprises learned a lot" from their urban counterparts about marketing, "creating a smoother path between production and sales."

The total output value of Wuxi's rural industries in 1985 totaled 8.6 billion yuan, and has been growing at an average annual rate of 34.8 percent over the last 7 years, according to city officials. They said rural production last year accounted for 48.8 percent of the city's total industrial output value.

JILIN CONFERENCE ON INDUSTRIAL PRODUCTION CONCLUDES

SK101415 Changchun Jilin Provincial Service in Mandarin 0930 GMT 8 May 86

[Excerpts] The fourth provincial conference on analyzing industrial production and economic results, sponsored by the provincial government, concluded in Changchun today. The conference affirmed the initial achievements scored in the previous stage in launching the activities of analyzing the economic results, pointed out the existing problems, and put forward specific requirements for further launching the activities of analyzing the economic results and for promoting a steady and coordinated development of industrial production through carrying out the activities.

Reporting on the situation of launching the activities of analyzing economic results at the conference were leaders of all cities, prefectures, and autonomous prefectures, and responsible comrades of the planning and economic commissions and provincial-level departments concerned. Cao Dezhan, governor of the provincial government, made a speech at the conference.

The conference held: The current situation of our province's industrial production is generally good. The province's industrial production in the first 4 months of this year showed an increase of 8.3 percent over the corresponding period last year. However, we still have many difficulties and problems in industrial production. Simultaneously, the activities of analyzing the economic results are proceeding unevenly. Some localities, departments, and enterprises yielded very few economic results due to their failure to thoroughly launch the activities of analyzing economic results or to take effective measures for promoting industrial production.

After summing up the experiences gained by various localities and viewing the current actual conditions, the conference called for efforts to grasp the following four tasks in order to further deeply launch the activities of analyzing economic results:

First, we should continue to deeply launch the activities of analyzing the economic results in order to achieve better economic results and to promote a steady and coordinated development of industrial production.

Second, we should pay special attention to analyzing the market situation and the quality of products, and concentrate efforts on grasping sales, raw materials, and marketable products.

Third, we should link the analysis of economic results with the improvement of enterprise management in order to achieve better economic results through enhancing enterprise management.

Fourth, we should combine the analysis of economic results with the stress on ideological and political work and the improvement of the economic responsibility system in order to ensure the fulfillment of all tasks for the first half of 1986.

The conference also set forth reformative measures for comprehensively fulfilling this year's economic targets, and encouraged cadres, workers, and staff members of the enterprises to make further efforts to upgrade the quality of products, reduce consumption and production costs, expand sales, handle the overstocked products, make the most of funds, upgrade work efficiency, save expenses, increase the production of marketable products, and turn deficits into profits.

The conference pointed out: We should strive to ensure a 10-percent increase in this year's industrial production, but must not change the goal of fulfilling more than half of the annual targets for output profits, and taxes by mid-year. We must firmly grasp industrial production in the crucial period of May and June. We should enhance our leadership over and give careful instructions to the industrial production, immediately mobilize forces to take resolute measures and policy decisions for firmly grasping the industrial production, and concentrate potential on the industrial production in order to achieve real results in it.

LIAONING HOLDS CONFERENCE ON URBAN REFORM

SK020338 Shenyang Liaoning Provincial Service in Mandarin 2100 GMT 1 Jun 86

[Excerpts] The provincial conference on urban economic reform called for a correct analysis of the current situation in economic structural reform and steadfast efforts to deepen the reform. The key area of our province's urban economic reform this year is to develop lateral economic cooperation. This conference was held from 27 to 31 May. Comrade Zhu Jiazhen presided over the conference. Comrade Tan Liren relayed the guidelines of the national urban economic reform conference. Comrade Cheng Jinxiang relayed the guidelines of the national forum on institutional reform of selected medium-sized cities. The participants heard speeches by specialists and scholars on lateral economic cooperation. They also heard about the introduction of the experiences in trial overall reform of Shenyang, Dalian and Dandong, and the experiences of some enterprises in carrying out reform and lateral economic cooperation.

Attending the conference were leading comrades of the provincial CPC Committee, people's congress, and government, including Quan Shuren, Bai Lichen, Zhu Jiazhen, Wang Guangzhong, and Tan Liren. Also attending were responsible comrades of various provincial committees, offices, departments and bureaus; various city governments, economic structural reform offices, economic commissions, and economic and technological cooperation offices; and some large and medium-sized enterprises.

Bai Lichen, standing committee member of the provincial CPC Committee and vice governor of the province, spoke at the conclusion of the conference to summarize the conference.

After affirming our province's achievements in economic structural reform, Comrade Bai Lichen pointed out: In carrying out this year's tasks for reform, we should do a better job in overall urban reform, persistently place the focus on invigorating enterprises, particularly large and medium-sized ones, make a success of planning, guidance, coordination, service and supervision, actively establish a system of indirect administration, reduce intermediate links, improve macroeconomic control, open up and improve various markets, in particular markets of the means of production, money, and technology, further enhance the radiation capability of cities, and give play to their multiple functions.

Comrade Bai Lichen stressed: Supportive projects are necessary for us to ensure the healthy development of lateral economic cooperation. The present major obstacle to lateral economic cooperation is the old system under which no distinction was made between different departments and regions. Therefore, we should resolutely separate government functions from business management and delegate power to enterprises. We should be determined to readjust and consolidate administrative companies. Departments in charge of economic management should change their administration over enterprises into administration over trades. They should clearly understand that the cooperation in economic management should be focused on the cities, in particular the central cities, rather than regions or departments. We should adopt policies to encourage and support lateral economic cooperation. Based on the guidelines of the 30 regulations on further promoting lateral economic cooperation issued by the State Council, the provincial government has formulated supplementary regulations. All cities and departments should [words indistinct], and protect the legal rights and interests of economic cooperation organizations, and various quarters concerned.

Wang Guangzhong, vice chairman of the provincial People's Congress Standing Committee, also spoke at the conference.

NEI MONGGOL OFFICIAL VIEWS DEVELOPING EXTERNAL COOPERATION

SK170217 Hohhot Nei Monggol Regional Service in Mandarin 2200 GMT 15 May 86

[Text] At the regional meeting of directors of external economic and technological cooperation offices which concluded on 8 May, Liu Zuohui, vice chairman of the regional government, pointed out: In order to achieve the work of conducting external economic and technological cooperation, all leagues, cities, banners, and counties should bring their initiative into full play. In line with the principle of taking advantage of favorable conditions and avoiding weakness, maintaining mutual benefits, and adopting various forms to seek common progress, we should focus on grasping the cooperation between the enterprises throughout the region while never abandoning the principle of conducting cooperation with the places outside the region.

Comrade Liu Zuohui said: Our region has made an earlier start in conducting the economic and technological cooperation with outside places. Last year, the region imported 205 million yuan of funds, showing an increase of 67 percent over that of 1984 and accounting for more than 46 percent of the total imported funds during the Sixth 5-Year Plan period. A total of 814 fairly large economic and technological cooperation projects were carried out last year, a 13-fold increase over 1984. More than 8,000 were brought in from other places. This has helped accelerate the pace of the enterprises' technological transformation progress, improve the management level of the enterprises, and speed up the pace of upgrading and updating the products. Last year, the region developed more than 500 new products, some of which had ready markets among foreign countries.

Comrade Liu Zuohui pointed out: Practice has shown that small economic and technological cooperation projects can produce faster results than larger cooperation projects. All leagues, cities, banners, and counties should initiatively go into action to pay more attention to developing small projects. We will accomplish nothing if we only pay attention to large projects and westernization. We should seek truth from reality to develop cooperation in accordance with our region's economic strength. The five leagues and cities in the western part of the region and the four leagues and cities in the eastern part of the region should develop their cooperation with the Northeast Economic Zone in terms of technological cooperation and import of talented persons in order to help the enterprises accelerate the pace of technological transformation progress. We should strive to bring in some projects which need short construction time and can score rapid results, and some projects which can create great production and high results with less investment. Of course, we have to impose restrictions on some trades. For instance, the leagues, cities, banners, and counties are not allowed to develop the wool spinning industry at the same time. If they do it at the same time, the situation in which small enterprises occupy the fixed assets of large ones will emerge, and our region's advantages in developing wool spinning industry will soon disappear.

BU HE SPEAKS AT NEI MONGGOL FORUM ON ECONOMIC LEGAL SYSTEM

SK020326 Hohhot Nei Monggol Regional Service in Mandarin 2200 GMT 1 Jun 86

[Text] On the morning of 31 May, Bu He, chairman of the regional government, pointed out at the regional forum on building the economic legal system that strengthening such a system and managing the economy with legal means are necessary for reforming the economic structure. He called on leaders at all levels to enhance their understanding, to learn how to manage the economy with legal means, and to fully display the government organs' functional role of using legal means to manage the economy.

Comrade Bu He said: Since the 3d Plenary Session of the 11th CPC Central Committee, we have established more and more lateral economic ties along with the development of the national economy, the deepening of the economic structural reform, and the strengthening of the vitality of enterprises. Relations in the economic sectors have become more complicated and the market demands have changed remarkably. To cope with such a new situation, we must adopt economic and legal means and some necessary administrative means to control and regulate the economy and to keep it functioning, and infiltrate standard, coercive and stable laws into the administrative and economic means. We should legalize the administrative and economic means and turn them into the necessary fundamental criteria for the people to follow in order to bring economic management into the framework of law, to guarantee good control over the macroeconomy, to allow flexibility in the microeconomy, and to carry out reform in an orderly manner.

Comrade Bu He said: The Constitution and the law on regional national autonomy have given decisionmaking powers to the minority areas in managing their local economic construction and greater powers to the self-government organs in managing their own affairs. Therefore, we should proceed from the reality of our region's national, natural, and economic characteristics while formulating a series of economic laws and regulations with distinctive local features, make the state's legal principles our definite goals, and turn them into systems so that they will become our important means for exercising our rights for autonomy and for managing the economy in line with the law. This is of vital importance and is necessary for implementing the general principles of our economic work in the new period, promoting the deep development of the region's economic structural reform, and accelerating the region's socialist four modernizations drive.

Comrade Bu He stressed: We should comprehensively and correctly implement the rights given by the Constitution and the law on the regional national autonomy. While formulating local economic laws and regulations, we should strictly follow and observe the following principles: First, we should uphold the state's centralized unified leadership and safeguard the unity of the state. Second, we should adhere to the principle of democracy and equality. Third, we should adhere to the principle of common prosperity. Fourth, we should adhere to the principles of proceeding from reality and managing things in line with objective laws. Fifth, we should adhere to the principle of giving simultaneous consideration to the interests of the state and the local authorities in order to benefit the construction of the state and of the autonomous region.

XIAN FORUM VIEWS PROBLEMS IN STRUCTURAL REFORMS

HK300125 Xian Shaanxi Provincial Service in Mandarin 2330 GMT 29 May 86

[Excerpts] Leading comrades of the party and government in Xian City invited representatives of some advanced units in economic structural reform to a forum on 29 May to discuss the current experiences and problems in reform and the question of how to carry out reforms in greater depth. Leading comrades present included Dong Jichang, Yan Huanwu, (Shang Yingbin), (Feng Yuanshuo), (Ma Zhenhua), and (Shao Wuxian).

While affirming the achievements in reform, the participating enterprise directors and managers raised a number of current problems and put forward suggestions on how to improve the reforms. They all held: Good results have been achieved in reform. There is also resistance to reform. It is not easy to be a plant manager during a period of reform. Plant managers have great responsibilities but little power. Prices of raw materials have risen and there is a dire shortage of [word indistinct] is hard to hold one's own with charges and fines being imposed from various quarters.

They demanded that the upper-level leading departments issue explicit regulations clearly distinguishing between reform and unhealthy trends.

Dong Jichang, deputy secretary of the provincial CPC committee and secretary of the city CPC committee, spoke at the conclusion of the meeting. He specifically pointed out: The present excellent situation was gained through reform. All those enterprises that have achieved success in reform have leaders with emancipated minds who dare to innovate, stress the major affairs of state, and are not afraid of rumors, slanders, or attacks. Their leading groups are able to unite as one and work in concert. Such leading groups are extremely valuable. We hope they will continue in this fashion and strive to be vanguards in reform. I hope the departments concerned will understand and support the reformers.

XINJIANG MEETING DISCUSSES INDUSTRIAL PROBLEMS

HK100425 Urumqi Xinjiang Regional Service in Mandarin 1200 GMT 9 May 86

[Excerpts] A telephone conference on directing industry and communications, convened by the regional people's government yesterday afternoon, pointed out that although a good momentum of sustained development was recorded in production from January to April, the plan for the rate of progress was not fulfilled. All areas and departments must tangibly improve their work style, help the enterprises to solve specific problems, and mobilize the workers to strive to fulfill and overfulfill the production plans.

The region's industrial output value up to the end of April was 2.255 billion yuan, an increase of 9.68 percent over the same period last year. Output of 51 products showed increases. However, the output value during the period only amounted to 27.5 percent of the year's plan, thus failing to meet the demand for rate of progress. The increase in light industry output was below that of heavy industry. In particular, output value of the food industry declined by 12.93 percent compared with the same period last year.

Tuohuti Shabier, vice chairman of the regional government, pointed out at the meeting that not only has the region failed to fulfill the plan for rate of progress in industry and communications production this year; in addition, quality of some products has deteriorated, input has risen, and safety work and economic results have not been good enough. All areas and departments, and especially the leaders at all levels who are in charge of economic work, must pay serious attention to these problems. It is essential to fulfill the mandatory plans for May and June and ensure that 48 to 50 percent of the year's plan is fulfilled by the end of June. The leaders must be held accountable in places and departments that cannot fulfill their plans.

The region must vigorously increase output of best-selling products in accordance with market needs. Planning restrictions can be ignored on products for which there are sales outlets, guaranteed raw material supplies, and production capacity.

Tuohuti Shabier emphasized that the region must give prominence to improving product quality and lowering material input. A deadline must be set during May and June for restoring the quality of high-quality products that deteriorated during the first quarter. Substandard products must be improved, or the factories concerned should halt production for consolidation. We must apply tough reward and penalty measures to do everything possible to improve product quality, lower material input, and achieve all-round betterment of economic results in the enterprises.

XINJIANG LEADER ON SUPPORTING POOR AREAS, PROMOTING REFORM

HK300205 Urumqi Xinjiang Regional Service in Mandarin 1200 GMT 29 May 86

[Excerpts] Tomur Dawamat said in his report to the fifth session of the sixth regional people's congress that the work of supporting poor areas is an important task during the seventh 5-year plan. We must have a strong sense of responsibility and urgency regarding this work. We must basically complete the task of extricating people from poverty during the period of the plan.

He said: The regional authorities recently decided to allocate an extra investment of 100 million to Khotan, Kashi, and Kizilsu prefectures during the seventh 5-year plan, to be used in infrastructural construction such as water conservancy, electric power, and roads. Revolving funds totalling 10 million yuan are to be set up to support poor areas. Part of these funds are to be regarded as a bank loan [word indistinct] and used to support poor herdsmen with an average net income below 150 yuan and poor peasant households with a net income below 120 yuan, to help them develop production.

Various units in the region should provide counterpart support to the three prefectures. All sectors and trades should provide a certain amount of support in policy, capital, material, technology, and talent. Apart from the support provided by the region and various areas, it is even more important to mobilize the enthusiasm of the local cadres and masses to rely on their own efforts and take effective steps to transform the production conditions, take full advantage of local strongpoints, strive to develop production, and transform their poor appearance.

Tomur Dawamat said in his report: To do a good job in economic structural reform during the seventh 5-year plan, we must seriously implement this year the principle of consolidation, digestion, replenishment, and improvement, consolidate and develop the fruits of reform, and prepare for still greater strides in reform next year and the year after.

At present the government at all levels must get a thoroughly good grasp of the following tasks:

1. We must persevere in putting reform in the first place. The principal leaders must tackle this personally. On the basis of investigation, study, and full preparations, the region will convene a conference on urban structural reform work to sum up the experiences in reform and study how to press ahead with reforms, actively and steadily.

In order to strengthen leadership over reform, the autonomous region, all prefectures and cities, and government departments with many subordinate enterprises should have strong and effective organs to tackle structural reform work.

2. We must seriously check on the performance of all departments and units in implementing the State Council and regional policies and regulations on reform.

3. We must continue to do a good job in running the Urumqi City pilot project in comprehensive economic structural reform, and ensure that Urumqi truly plays its attraction and radiation role as a key city.

4. We must continue to attach importance to rural reforms and further perfect the socialist production and exchange modes, so as to mobilize the inherent vitality in rural social economy.

BRIEFS

AGREEMENTS WITH SICHUAN SOUTHWEST PROVINCES--At the recent third session of the economic coordination conference of Sichuan, Yunnan, Guizhou, Guangxi, and Chongqing, Sichuan Province had a full exchange of views with the other parties on further strengthening lateral economic ties and cooperation, and signed 85 cooperation agreements with them. An agreement was signed with Guangxi on jointly raising capital for constructing the Sichuan natural gas chemical plant, to produce 300,000 tons of synthetic ammonia and 520,000 tons of urea a year. The Sichuan Provincial Chemical Industry Department will invest 400,000 yuan in helping to construct a tin oxide production line in Gejiu City, Yunnan. The agreements signed include those for ties between industrial enterprises, and for joint operations and sales by commercial departments. Some agreements also involve joint export efforts. Some new materials supply agreements were also signed. [Excerpts] [Chengdu Sichuan Provincial Service in Mandarin 0930 GMT 28 May 86] /9604

FORUM ON DEVELOPING SOUTHERN GANSU ECONOMY--A provincial CPC Committee and government forum on speeding up economic development in southern Gansu, which concluded on 30 May, proposed that the fundamental tasks in economic construction there are, guided by Comrade Hu Yaobang's instructions delivered during his visit to the area, to display the spirit of arduous struggle and hard work, vigorously develop commodity economy, and lead the masses to eradicate poverty and get rich as soon as possible. During the forum, responsible comrades of provincial departments and of the prefectures and counties in the area seriously discussed five draft plans, and unanimously held that the principles and policies devised by the provincial CPC Committee and government for developing southern Gansu's economy are in accord with local reality and show fine prospects for the people there to eradicate poverty and get rich as soon as possible. Provincial CPC Committee Secretary Li Ziqi, Governor Jia Zhijie, Provincial Advisory Commission Vice Chairman Ge Shiying, and Vice Governor Lu Ming attended the forum and spoke. [Excerpts] [Lanzhou Gansu Provincial Service in Mandarin 2200 GMT 30 May 86] /9604

WEST SICHUAN ECONOMIC MEETING--A discussion meeting of the western region of Sichuan on the economic and social development strategy opened in Chengdu today. The participants are mainly studying and discussing the role and functions of the economy of the western region of Sichuan in the whole province, the favorable conditions for future development, and restrained factors. The meeting is also studying and discussing the leading industries and the problems of cooperation in specialization in the western region of Sichuan as well as the problems of how to give play to the role of the key cities of the western region of Sichuan and the problems of economic cooperation of the urban and rural areas. The conferees hope to achieve the aim of exchanging information, whipping up public opinion, putting forward suggestions, and promoting work, the development of the economy, and study of the strategy of this region. Some 150 people of eight cities, prefectures, and autonomous prefectures of the western region of Sichuan and relevant departments at the provincial level are attending the discussion meeting. Governor Jiang Minkuan and Chengdu City CPC Committee Secretary Wu Xihai attended the meeting and spoke. [Text] [Chengdu Sichuan Provincial Service in Mandarin 0930 GMT 27 May 86] /9604

INDUSTRIAL PRODUCTION URGED--Industrial output of the region from January to April this year was 4.6 percent more than in the same period last year. Of the output, the total output of eight prefectures recorded an increase of 9.24 percent. However, industrial production in five cities was lower than the region's average rate of increase. To quickly change this situation, Wang Rongzhen, vice chairman of the regional People's Government, put forward five demands: 1) It is necessary to seriously do well in grasping the implementation of the policies. 2) It is essential to correctly understand the speed of Guangxi's industrial development. 3) It is imperative to really do a good job in grasping technological transformation. 4) We must lighten the burdens of enterprises. 5) While grasping production, we must attach importance to quality, strive to reduce consumption, and pay attention to safety in production. [Text] [Nanning Guangxi Regional Service in Mandarin 1000 GMT 11 May 86] /8309

JOINT DEVELOPMENT--In a recent visit to Fangchang Port in Guangxi, the station's reporters were told by (Zhang Jingze), director of Fangcheng Port administration committee, that the port would adopt much more preferential treatment than other ports and warmly invited the province's companies, enterprises, and customers to jointly develop and use the port. (Zhang Jingze) said: Following the inauguration of the railway link to southern Guangxi, the shipping distance for coal exported from Liupanshui can be reduced by 455 kilometers when compared to the distance to Zhanjiang Port. Guizhou Province's raw materials and goods such as phosphate ore, [word indistinct] ore and heavy metals can also be exported through this port. He said: Any Guizhou enterprise that is formed at the port may, before the contract concerned expires, have a 65-percent reduction of income tax. Enterprises that engage in 10-year and more operation may be exempted from taxes for the first 3 profit-making years. Also, their income tax will be cut by 50 percent between the fourth and sixth profit-making year. He also said: The port administration committee will [be] making appropriate arrangements for the difference between the foreign exchange amount required and the payment by Guizhou's enterprises established at the port when importing equipment, raw materials, and accessories. REGIONAL ECONOMIC INTEGRATION--Shenyang, 6 May (XINHUA)--Shenyang, Changchun, Harbin, and Dalian Cities and Nei Monggol's Chifeng City, and Xingan, Hulun Buir, and Jirem leagues have decided to hold joint meetings of mayors and league heads to organize themselves into a loose regional organization for lateral economic integration. Recently, the first such meeting was held in Shenyang where the participating cities and leagues signed a protocol on the methods and objectives of mutual coordination. They agreed to work together to develop one another's resources, produce brand-name and quality products, expand the processing of farm and sideline products, and promote foreign trade, tourism, transportation, as well as exchanges of personnel and technical information. [Summary] [Beijing XINHUA Domestic Service in Chinese 0130 GMT 6 May 86 OW] /8309

INVIGORATING ENTERPRISES--The provincial people's government has decided that beginning in mid-May, an all-round large-scale inspection should be carried out throughout the province with a view to invigorating enterprises. The provincial government has demanded: During the large-scale inspection, it is necessary to implement the relevant policies and regulations on invigorating enterprises which have been issued by the State Council and the provincial government over the past few years. It is essential to help enterprises resolve their practical problems. Where we have not implemented what the documents of the central and provincial authorities expressly provide, we must resolve the problems on the spot during the large-scale inspection. Where obstruction occurs in a unit at a level, the unit at that level must be responsible for resolving the problem. If a problem involves a department, that department must be responsible for resolving it. We must not shift our responsibility for resolving problems to our upper levels. Moreover, we must prevent formalism and doing things perfunctorily and superficially. This large-scale inspection must conclude in the beginning of June at the latest. [Text] [Guangzhou Guangdong Provincial Service in Mandarin 0900 GMT 8 May 86] /8309

ANHUI SMALL COMMODITIES' TRADE--The Anhui Provincial CPC Committee and the provincial people's government recently adopted five measures regarding the production and sale of small commodities. They are: 1) Conscientious efforts should be made to solve the problem of raw and semifinished materials. Planning and materials departments at various levels should make special arrangements for the supply of rolled steel, nonferrous metals, and other raw and semifinished materials for the production of small commodities. 2) Commercial, supply, and marketing departments should step up their efforts to deal in small commodities. 3) Restrictions on small-commodity prices should be really lifted. 4) Consideration should be shown to small-commodity producers and dealers in credit and taxation. 5) Economic benefits for those producing or dealing in small commodities should be rationally regulated. FACTORY PRODUCTIVITY INCREASED--Shanghai, May 5 (XINHUA)--Joining academic theory to production line practice, 59 colleges and universities here have been helping factories throughout China increase productivity. The combined efforts generated an additional 500 million yuan last year alone, the Shanghai higher education technical service center said today. Altogether 1,400 Chinese enterprises have been involved in 167 academic projects combining teaching, research and production improvements, the center said, including advanced training of 672,700 workers. One project, involving Jiaotong University and seven electrical transformer plants here and elsewhere in China, developed high-voltage testing equipment that eliminated the need for expensive imports. Another saved an organic chemical plant on the outskirts of Shanghai. The plant was about to close down for lack of sales, but with research ideas from the East China Chemical Engineering Institute, it developed a new line of successful products. FINANCE AND BANKING

GUIDELINES PROVIDED FOR YEAR-END FINANCIAL ACCOUNTINGS

Beijing CAIZHENG [FINANCE] in Chinese No 12, 8 Dec 85 pp 10-12

[Article: "Ministry of Finance Circular on Preparation of 1985 Year-End State Accounting"]

[Text] The task of preparing the 1985 year-end state accounting is about to begin. Right now all jurisdictions and departments are in process of conducting a major check of national tax revenues and finances while paying strict attention to increasing receipts and limiting expenditures of public funds. In order to improve the quality of the 1985 year-end state accounting and make the accounting genuinely reflect national financial and economic activity for the year as well as new achievements in restructuring of the economic system, a notice on basic requirements and relevant issues in preparing the year-end state accounting is provided as follows:

1. Unified Conception and Efforts To Balance Receipts and Expenditures

This year's financial and economic situation has been very good. The State Council's call for the eradication of a 3 billion yuan deficit from this year's original budget is both a glorious and a daunting assignment. There are very many factors favoring achievement of this task; nevertheless, one must also realize that there have been quite a few financial factors during the fourth quarter of 1985 that will reduce income and increase expenditures. Accomplishment of this task will require that we make a very great effort. All jurisdictions and sectors will have to conduct a large scale check of their tax revenues and finances and will have to put in order their year-end accounting. They will have to devote serious attention to increasing income and decreasing expenditures before the beginning of the year, and they will particularly have to guard against the abnormal situation that occurred during the fourth quarter of 1984 in which a large bulge in expenditures occurred, actively balancing the budget for the current year.

In the income area, they must conscientiously straighten out instances of tax cheating, tax evasion and defaults in tax payments, all monies due being paid in full into the treasury and included in the 1985 accounting of receipts. Units and individuals that have cheated on their taxes, evaded taxes or defaulted on payment of their taxes are to pay sums due to the treasury at once in strict conformity with provisions of tax laws. Instances in which authority has been exceeded to permit reductions or exemptions from tax payments must be resolutely corrected, all taxes that should have been paid being paid retroactively. The two gaps of revenue refunds from the treasury and business repayments of loans must be strictly plugged. Demands for refunds from the treasury must be handled strictly in accordance with provisions of national regulations. Diligence is to be exercised in the investigation of cases involving fraud, refunds made on the basis of false estimates, and losses stemming from false reporting, and every effort made to recover such funds. Businesses must act strictly in accordance with regulations, repaying loans from added profits once projects for which loans have been used go into production. Making an issue of repayment of loans and resorting to all sorts of tactics to hold on to earnings that should be paid into public funds positively cannot be permitted. Banks must collect loan funds from those responsible for making repayment, and they may not contravene regulations to act forcibly to attach loan funds or waive payment of profits due from enterprises. They should link major checks of finances to diligent auditing of all income received from fines and confiscations as well as the "petty cash" held by all units. They must resolutely correct all situations in which there is embezzlement of revenues due the national treasury in violation of financial and economic discipline such as willful retention of tax monies and profits due and the off-the-books keeping of accounts.

Simultaneous with firm grip on work pertaining to financial revenues during 1985 should be particularly stringent control and restriction of disbursements as the key to balancing national financial income and expenditures during 1985. All jurisdictions and sectors should act in the spirit of the instructions from the State Council and requirements of the August 1985 conference on national financial work to effect strict control over disbursements for capital construction, bending every effort to reduce the administrative expenses and purchasing power of social groups, striving to economize wherever economies are possible. Treating appropriations as payments, use of claims in place of reports, and making false reports and claims as well as other expenditures that contravene the fiscal and financial system must be resolutely corrected and not made a part of final settlement payments for 1985.

Financial units at all levels are to act under leadership of local governments in accordance with control criteria for 1985 financial payments handed down in August 1985 by the national financial work conference to exercise strict control and achieve a balance through their own efforts.

Abolition of the 3 billion yuan deficit in the 1985 national budget and striving to realize a balance between receipts and expenditures is a major task on the frontline of finance during 1985. It is also a basic requirement in the preparation of the state accounting for 1985. Efforts should be made to increase revenues somewhat while controlling expenditures more stringently. Simultaneous with taking firm grip on the task of increasing revenues and controlling expenditures before the arrival of the new year, all jurisdictions and all sectors should conscientiously prepare their final accountings for 1985 to make a contribution to a balanced budget for the year.

2. Diligent Preparation of the Financial Accountings of All Departments and All Units

Unit financial accountings are the foundation for national financial accounting. There must be a diligent level by level preparation of accountings beginning with grassroots units in order to insure quality of this year's national financial accountings.

In examining the financial accountings of enterprises, the focus should be on checking costs and the kinds of things for which expenditures have been made, all problems concerned with juggling costs and payments that are not in accord with regulations being corrected. The status of enterprises' loan repayments should be checked and all issues involving loan repayments not consistent with regulations corrected. The status of profit retention by enterprises should be prepared and all matters involving arbitrary liberalization of policies and the allowing of profits through reduction of tax payments are to be corrected. The process whereby failing enterprises were able to turn losses into profits should be looked into, and all problems involving violations of regulations and wilfully obtaining refunds from the treasury to make up for losses should be corrected. Public funds are not to be used to bail out either enterprises that have not been able to turn around their losses during the plan period or those that have newly incurred losses as a result of inept administration and management. The financial accountings of foreign trade enterprises, grain enterprises and commercial enterprises should be scrutinized particularly carefully, and both enterprises losses and premium prices paid for excess procurement of grain should be diligently verified. Subsidies paid for losses based on fraudulent reporting and claims must be recovered in toto. All money obtained as a result of changing "parity prices to negotiated prices" and "negotiated prices to excess procurement prices," thereby obtaining illegally premium prices for excess procurement of grain are to be paid in toto into the treasury.

Separation of national budget funds from funds owned by banks is to be conscientiously prepared in connection with financial accountings for capital construction. That portion of capital construction payments that exceeds the state authorized "change from appropriations to loans" may not be included in the accounting for 1985. Determination should be made as to whether a clear distinction has been made between funds for capital construction obtained through a "change from appropriations to loans" and disbursements of banks' own funds for capital construction. Disbursements of banks' own funds in loans for capital construction should not be included in the national budget as capital construction payments in the nature of a "change from appropriations to loans," much less should appropriations be treated as payments or claims be used in place of reports.

In the checking of financial accountings of administrative units, emphasis should be placed on how well administrative expenses have been decreased with particular emphasis going to the checking of curtailment of payments for purchases of equipment, for repairs, for conferences and for personnel in excess of authorized strength. Standards for payment of expenses should be rigorously enforced. In accordance with State Statistical Bureau, the former State Construction Commission, and Ministry of Finance Notice No 234 (1978) as well as the provisions of State Statistical Bureau (84) supplementary notice Caiwenzi No 106, all expenses having to do with capital construction are to be eliminated from administrative expenses and placed in the category of payments for capital construction. A diligent preparation should be made and an explanation provided in cases where control standards handed down for 1985 have been exceeded. Emphasis should be given to preparation of how well consumption funds are controlled in financial accountings of entrepreneurial units; "petty cash funds" should be conscientiously audited, and wholesale awards of bonuses, subsidies and material goods on various pretexts should be corrected resolutely.

3. Strict Enforcement of Financial and Economic Discipline and Conscientious Handling of Problems in the Course of Preparation of Final Accounts

All jurisdictions and units should handle problems that arise in the course of examining final accounts in the spirit of Ministry of Finance "Notice On Preparation of Reports on Major Inspections of Tax Revenues and Financial Affairs," which was approved and forwarded as State Council (1985) Document No 101, plus Ministry of Finance (85) Document Caigongzi No 314 titled, "Various Regulations on Handling of Problems Pertaining to Finances in the Course of Major Inspections of Financial Matters." They should also conduct inspections and dispose of matters in accordance with relevant financial and accounting regulations, and they positively cannot allow matters to remain unsettled. They must genuinely insure that laws exist to be followed, that laws will be strictly enforced and violations of laws will be punished. In serious cases of premeditated tax evasion and violation of financial and economic discipline, not only are all illegal gains to be confiscated in entirety, but those directly responsible are also to be punished administratively in accordance with Party discipline and government discipline. Those who violate criminal laws are to be held responsible for their crimes according to law.

4. Strengthening of Organizational Leadership For the Preparation of Final Accountings

The year-end state accounting is the culmination in implementation of the national budget. It is the financial focus of national economic activity for the whole year. Financial and fiscal departments at all levels should treat as an important matter the preparation of the 1985 year-end accounting. In the task of examining the 1985 year-end accounting, firm grip should be taken on the three links of year-end auditing, preparations for the new year and preparation and collation of the past year. This requires auditing of budgeted expenditures, a final settlement of current sums, an inventorying of assets and property, verification of figures and diligent reconciliation of accounts. This requires both efforts to increase income and limit expenditures and guarding against "spending what one does not yet have." However, problems that should be handled in the current year will also have to be handled to insure the truthfulness and reliability of all final accounting figures. This will entail self-preparation, mutual preparation and preparation by higher authority of key areas in individual units. It will require diligent summarization of restructuring of the financial, fiscal and tax collection systems during the year and new developments, new experiences and new problems in budget and fiscal management, using preparation of year-end accounts as a means for raising the level of management of budgetary and fiscal work, for exploring, improving and giving impetus to new ways of restructuring the financial, fiscal and tax collection systems. It will require reporting within the time limits set by higher authority of all fiscal accountings and financial accountings in order to insure that the year-end state financial accounting is prepared and collated promptly.

Little time is available for preparation of final accountings for 1985 and the task is an arduous one. Financial departments and units in charge at all levels should exchange information on the whole process of preparing final accountings, control the pace, go down among the grassroots and provide supervision and assistance. Units and individuals who do a good job of year-end accounts preparation should be accorded recognition and rewards. Units and individuals rendering a poor performance should be criticized and indoctrinated. Higher authorities have the authority to suspend disbursements of budgeted funds to those who are seriously derelict in the reporting of final accounts. Leading comrades at all levels in financial and fiscal departments should strengthen organizational leadership for the preparation of 1985 year-end accounts. They should supervise, urge on and inspect to make sure that the work of preparing year-end accounts for 1985 is completed on time, smoothly, and with good quality.

5. Ideas For Dealing With Several Specific Problems in the Work of Preparing Year-end Accountings

(1) All surplus funds remaining in 1985 from payments by local financial jurisdictions are to revert to the local jurisdictions in entirety. This is to include surpluses remaining from payments of funds disbursed by the central government for specific purposes. Except for funds that are to be rolled over in accordance with regulations for continued use during the following year, all other funds are to revert to local financial organizations and centralized plans made for their use. All surpluses remaining from expenditures within the purview of local financial organizations should be controlled and rolled over in the spirit of centralized funds. In cases where plans for a project have been completed, no further rolling over of funds is to occur. In cases where plans for a project may not have been fulfilled or where the project may either not be carried out or delayed, no further rolling over is necessary as well. When it is necessary to roll over funds, whether or not local jurisdictions have the financial resources to handle the situation should also be looked at, a roll over being done when money is available, but no roll over being done when no money is available. There can be no uncontrolled rollovers while financial authorities at a higher level are requested at the same time to provide the funds needed to make the roll over.

(2) In 1985 year-end central and local financial accountings, in addition to items that have been routinely adjusted upward or supplemented, as well as those for which there has been a general rise in plan or lowering of plan, or increases or decreases in the process of budget implementation for which a year-end accounting is to be prepared in accordance with the provisions of pertinent documents in the existing financial system, the Ministry of Finance will provide specific final accounting procedures to be followed for items about which the state has uniformly adopted financial and economic measures

and which by regulation require an independent accounting by central and local financial units. The ministry will request all provinces, autonomous regions and municipalities under direct jurisdiction of the central government to provide detailed and accurate figures and data as required when they report their overall financial accounting as an aid in the verification of final accountings.

(3) For year-end "budget responsibility surpluses" of administrative entrepreneurial units at all levels that instituted a system of budget responsibility in 1985, the budget rollover method is to continue to be used. Such surpluses should not be handled as expenditures in the financial accounting in order to avoid or reduce financial surpluses for the current year.

(4) According to the provisions of Ministry of Finance and Construction Bank Head Office (85) Jianzongzongzi No 18 titled, "Notice on Problems in Budget Management of Expenditures For National Capital Construction Following the Change From Appropriation of Funds To Loans For Capital Construction," state budgeted disbursements to the Construction Bank at all levels of capital construction loan funds (including interest-free loans) are to be included as financial expenditures in final accountings at year's end on the basis of the actual amounts of funds disbursed (i.e., bank payment figures). The use of claims instead of reports and of appropriations for expenditures is not allowed. Payments for investment using loans instead of state appropriations are to be entered separately into year-end accountings for individual years according to their source. Capital construction investment loan funds that the Construction Bank at all levels have recovered are to be listed before the end of the year in the proper amounts as income paid to the treasuries of the central or local governments from capital construction budgets.

(5) As of 1985, the national treasury will no longer pool enterprises' basic depreciation funds; however, for 1984 when local finance departments and the central financial authorities prepare independent year-end accountings, amounts of basic depreciation funds owed the central treasury by local enterprises are to be paid to the central treasury in accordance with the relevant notice from the Ministry of Finance. If such sums have been already carried as income into local treasuries, corrections are to be made before the end of the year and payment made to the central treasury.

Beginning in 1985, the national budget will no longer carry receipts and expenditures of enterprises' payments of basic depreciation funds. Consequently, the basic depreciation funds amassed by certain local treasuries are to be handled as funds outside of financial budgets and are to be included as unlisted receipts and expenditures in the year-end final accounting. If such funds have already been included as listed receipts and expenditures in local financial accountings, a change should be made so that the final accounting agrees with the budget.

(6) In accordance with State Council Guofa (1985) No 35, Ministry of Finance (85) notices Caiyuzi Nos 51 and 85 provide that price increase funds for excess procurement of grain and oil," "subsidies for readjustment of meat prices," and "subsidies for price differences for lard used to manufacture

soap" are to be changed from income refunded from the treasury and listed as budgeted expenditures, and none of them is to be refunded from stated budgeted income. Anything that cannot be handled in accordance with the foregoing regulations is to be straightened out before the end of the year.

(7) In 1979, central government financial authorities used a reduction in funding by the Construction bank to suspend large and medium size capital construction projects and fell in arrears on funds earmarked for equipment in production enterprises. Six years have passed, but the reduction is still not finished. All levels of the Construction Bank must take firm grip on auditing and a final accounting by the end of 1985 and prepare a special report before the end of February 1986 on results of the reduction for the Construction Bank main office and the Ministry of Finance.

(8) In order to help the year-end audit, all enterprises and entrepreneurial units that make reciprocal transfers among local budgets and central government budgets before the end of November and who take care of financial procedures should promptly settle accounts and prepare final accounting reports as their financial subordination requires after transfers have been made.

An original and six copies of summary financial accountings from all provinces, autonomous regions and municipalities under central government jurisdiction are to be filled in on the standard form printed and distributed by the Ministry of Finance and sent to the ministry. An original and six copies of the summary financial accountings from the cities of Shenyang, Dalian, Haerbin, Wuhan, Guangzhou, Chongqing and Xian are to be sent to the Ministry of Finance at the same time that they are sent to the provincial departments of finance for examination, verification and compilation. In order to prepare well for the advance year-end accounting report to be given at the NPC, which will convene in late March 1986, all provinces, autonomous regions and municipalities directly under central government jurisdiction will please send to the Ministry of Finance the "Overall Table Showing Receipts and Expenditures" (the current year receipts and expenditures portion) of the Overall Final Financial Accounting after it has been verified and approved by the People's Government. At the same time that they send the "Overall Final Financial Accounting" to the finance departments of their provinces or autonomous regions, coastal cities open to the outside world including Qinhuangdao, Yantai, Qingdao, Lianyungang, Nantong, Ningbo, Wenzhou, Fuzhou, Zhanjiang and Beihai as well as the four special economic zones and the Hainan administrative district are to send a copy to the Ministry of Finance. Specific regulations, final financial accounting forms and other documents pertaining to final accountings from all provinces, autonomous regions, municipalities directly under central government jurisdiction and seven cities specifically listed for the preparation of financial accountings are to be copied for the reference of the Ministry of Finance.

In order to prepare for the advance year-end accounting report to the NPC that is to be convened at the end of March 1986, the "Bank Payment Figures Collated Tables" (including all "verification") that are a part of the final accountings prepared by the collating units in all departments in charge should be reported to the Ministry of Finance before the first week of

February following verification of accuracy and approval by those in charge in units concerned. An original and three copies of all other tables are to be submitted no later than 20 March as in past years to the Ministry of Finance.

The 1985 Central Budget Income Annual Report from the treasuries of all provinces, autonomous regions and municipalities directly under federal government jurisdiction are to be reported to the central treasury before the end of January 1986 following reconciliation and verification of accuracy. In this connection, provincial financial units should make prompt verification and authentication without delay in order to insure on-time reporting on the national treasury.

Preparatory work must also be conscientiously carried out in accordance with the spirit of this regulation for unbudgeted national defense funds. Specific methods are to be prescribed by the General Logistics Department of the PLA, a copy provided to the Ministry of Finance for reference. The principle to be used in drawing up a final accounting of expenses for the People's Armed Police should be to follow the specific methods that the General Logistics Department prescribes for the PLA, the People's Armed Policy Headquarters drawing up the regulations and sending a copy to the Ministry of Finance for reference. An original and three copies of a collated final accounting of expenses of the People's Armed Policy is to be sent to the Ministry of Finance before the end of February 1986.

FINANCE AND BANKING

HENAN TO ISSUE ROAD CONSTRUCTION BONDS

HK100533 Zhengzhou Henan Provincial Service in Mandarin 2200 GMT 9 May 86

[Excerpts] The provincial people's government recently approved the move of the provincial communications department in commissioning the provincial construction bank to issue road construction bonds within the province for 3 years, commencing this year. This is being done in order to rapidly improve the backward state of the province's road communications, speed up road widening and associated projects, and stimulate development. The province will issue 80 million yuan worth of these bonds this year. The amount to be issued in the next 2 years is still to be decided.

The capital raised in this way will be allocated in a unified way by the provincial communications department. It will mainly be used in improving and repairing main roads, and upgrading road surfaces.

Those eligible for purchasing the bonds are units and individuals possessing automobiles. The provincial communications department will allocate the purchasing quotas to the prefectures and cities based on the number of automobiles at the end of last year, and the prefectural and city communications departments will be responsible for organizing the bond purchases.

Enterprises can use their own capital for buying the bonds. They must not use their mobile funds or bank loans or add the bond cost to their production costs.

Annual interest on the bonds will be 3.6 percent, calculated from 1 October each year. The bonds will mature in 5 years. All bonds will be redeemed on the 1 October of the sixth year after purchase.

MINERAL RESOURCES

XINJIANG TO INCREASE SEARCH FOR NATURAL RESOURCES

OW280753 Beijing XINHUA in English 0636 GMT 28 May 86

[Text] Urumqi, 27 May (XINHUA)--The Xinjiang Uygur autonomous region will step up resource exploration during the 1986-90 period to prepare itself for an economic take-off scheduled for the end of this century.

By 1990, Xinjiang expects to verify oil reserves of 17.5 billion bbl in the Junggar basin and add 300 million tons of coal reserves, said Tomur Dawamat, chairman of the regional government.

The region's crude oil output is expected to reach anywhere from 50.4 million to 56 million bbl by 1990, an increase of 15.4 million to 21 million bbl over 1985.

With an area accounting for one-sixth of the country's total, Xinjiang is rich in natural resources. Some 118 kinds of minerals have been found in the area.

One major task during the five-year period is to step up the exploration of oil and gas in the Junggar basin, Tarim basin and Turpan depression.

Exploration of gold reserves will be conducted in western Junggar, while efforts are to be made to conduct geological surveys on diamond reserves in the south of the Tianshan mountains.

In the west of the Tianshan mountains, exploration will center on phosphorous reserves. Geological surveys will also be conducted of copper, chromium, lead, zinc, iron, platinum and tin.

Hu Yaobang, Zhao Ziyang and other Chinese leaders have time and again stated that by the end of this century, Xinjiang and other parts of the northwest would receive priority in China's economic construction.

LI PENG DISCUSSES AUTO INDUSTRY DEVELOPMENT

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 28 Dec 85 p 3

/Article: "Emphasizing Development of Heavy and Light Motor Vehicles, Li Peng /2621 7720/ Talks About the Course of Automobile Development for the Seventh 5-Year Plan"/

/Text/ State Council Vice Premier Li Peng today pointed out the following at the National Automobile Industry Work Conference: During the Seventh 5-Year Plan, China's automobile industry should proceed along the path of coordination, starting from a high plane, specialization, and volume production. In order to enhance overall control we should digest and incorporate imported technology. On the basis of raising the technical level of medium-sized vehicles, we should also emphasize the development of light and heavy motor vehicles that suit the needs of the people's developing economy.

Li Peng said that in the wake of China's economic development communes and transportation facilities undergoing change, and mobility and flexibility of automobile transportation all showing good results, we should also implement the advantages of "door-to-door" transportation that is now playing more and more of a role with branch railroads. Currently, China's automobile production is mainly composed of 4- and 5-ton medium-sized vehicles, with few heavy and light vehicles being produced. To keep containerized traffic in pace with agriculture commodity production, the development of heavy and light vehicle needs to be emphasized. Cars with low fuel consumption and cheap prices will also be placed higher on the agenda.

Li Peng also pointed out: The one common law of the world's automobile development is that of coordination. China's auto industry, through specialized transportation departments and regional coordination and cooperation of transportation should form a certain number of joint entities and should produce several best-selling products. Development of the auto industry during the Seventh 5-Year Plan should concentrate on tapping latent powers, and by digesting and incorporating imported technology do a good job of technology transformation, raising quality and technology levels, and developing production capacity. The China Automotive Industry Corp. should do a good job of overall control, and formulate development plans and specific and general policies on behalf of the country to guide the auto industry along the path of coordination, starting from a high plane, specialization, and large volume production.

The National Automobile Industry Work Conference opened in Beijing on 21 December, participating in the conference are ministries and commissions under the State Council; the National Defense Science, Technology, and Industry Commission; various provincial and municipal machinery departments; and responsible persons of the automobile industry.

INDUSTRY

MAIN ACHIEVEMENTS IN LIGHT INDUSTRY OUTLINED

Beijing ZHONGGUO QINGGONGYE BAO in Chinese 5 Jan 85 p 2

/Article by Chen Zhuanqi /7115 0278 1142/: "China's Light Industry Is Brimming with Vitality and Continuing To Develop, Looking Back at the Main Achievements in Light Industry During the Sixth 5-Year Plan"/

/Text/ During the Sixth 5-Year Plan, the party and state formulated a series of plans, policies and measures favorable to the development of light industry. These effectively spurred the development of light industry, and through the hard work of vast numbers of workers and staff on the light industry front, the main goals of the Sixth 5-Year Plan have been basically realized. With some goals being completed 1 or 2 years ahead of schedule and the face of light industry undergoing a great change.

1. A relatively high rate of increase has been maintained in the development of light industry. The Sixth 5-Year Plan set the gross output value of light industry for 1985 at 131.7 billion yuan, a yearly increase of 7 percent. The actual result was that in 1984 the gross output value had already reached the level of 132.56 billion yuan, attaining the set goal 1 year ahead of schedule. The average annual increase for the first 4 years of the 5-year plan was 9 percent and it is estimated that the total output for 1985 will be 156 billion yuan, which would mean an average annual increase of 10.7 percent. The increase in output value for the 5 years add up to 62.1 billion yuan, or 12.4 billion yearly.

The output volume goals set by the Sixth 5-Year Plan for 33 main products will mostly be met or surpassed, among these, products that attained their goals 2 years ahead of schedule include cardboard, washing machines, plastic products, light bulbs, matches, furniture, electric fans, rugs, and specialized weighing equipment.

2. There were large increases for main products, product quality improved markedly, and numerous new products and varieties were developed. Through 5 years of hard work the production of famous products and products the market was critically short of were redoubled. In comparison with 1980, beer production increased 270 percent, washing machines 3.3-fold, refrigerators 28-fold, and laundry soap, household drinking glasses, and milk products all increased more than 100 percent. The manufacture of famous bicycle brands "Fenghuang,"

"Yongjiu," and "Feige" increased from 5 million in 1980 to 9.63 million in 1985. In addition, locally manufactured brands that accounted for 38.4 percent of all bicycles prdouced in 1980 now account for over 65 percent of all bicycles produced. The attitude of "putting quality first" and wholeheartedly serving the consumer is just now being initiated. Product quality has had marked improvement since 1980, many products have changed long maintained appearances and are now being produced according to international standards. Along with raising the level of production technology, each year over 5,000 new products, varieties and designs were developed. Since 1979, many light industry products have won state gold and silver awards for quality, industrial art Baihua awards and Ministry of Light Industry Excellent Product Quality Awards. Some famous brands have won international gold and silver awards for China. Light industry commodity market sales totaled 484 billion yuan during the Sixth 5-Year Plan and accounted for 36 percent of consumer retail sales during the same period, this played an important role in invigorating town and rural markets and in improving the peoples lives.

3. Through reorganization and reform the economic results of enterprises showed a marked improvement. It is estimated that in 5 years the light industry system accumulated 133 billion yuan in taxes and profits for the state, which is equivalent to 5.5-fold the amount of fixed investment assets of light industry during the same time span. Light industry basically realized increases in production, income from sales, and profits at the same time.

4. Outstanding progress was made by utilizing foreign capital and imported technology. Between 1979 and 1984 the amount used for importing technology and equipment totaled 2 billion dollars. This exceeded the amount spent during the previous 30 years. Most of these imported items have already shown success.

5. Putting emphasis on construction has been strengthened and the technical transformation of enterprises is starting to unfold. It is estimated that the fixed investment assets for light industry during the Sixth 5-Year Plan was 24.33 billion yuan, with investment in capital construction being 9.83 billion yuan and funds for replacement and overhaul totaling 14.5 billion yuan. In 5 years, fixed assets were increased by 22.5 billion yuan. There have been 160 large and medium-sized projects completed and put into operation, and the production capacity of some short production lines has been increased.

6. Integration of the diversified economy has been further developed, such as better coordination between light industry enterprises, between towns and rural areas, and between industry and trade to increase exports, and better coordination and cooperation between factories, educational institutions and scientific research, design and equipment manufacturing departments. In practice it has been proven that "light industry relies on coordination," it is the road that China's light industry development must follow.

7. New developments in science and technology and personnel training have been made. During the Sixth 5-Year Plan, the majority of key state S&T research projects that light industry was responsible for were completed, with 25 of these projects earning state invention awards. S&T achievements were used to spur on light industrial production, which made gratifying results. The number

of students in educational institutions directly under the Ministry of Light Industry reached 13,200 during 1985, an increase of more than 100 percent over 1980. Various forms of adult labor education made especially rapid progress, these programs trained many qualified technicians and managers for light industry.

SHIPBUILDING TECHNOLOGY RAPIDLY IMPROVED

Beijing CHUANBO SHIJIE in Chinese 31 Jan 86 p 1

[Article by Hong Lun [3163 0178]: "China's Shipbuilding Technology Rapidly Raised. Capable of Producing Ships to International Standards of the Eighties."]

[Text] China's shipbuilding industry started to enter the world market in the Sixth 5-year Plan. Exports contributed to the overall enhancement of technology, rapidly narrowing the gap with the world's advanced technology; now China is capable of producing civilian vessels to world standards of the eighties.

China has the capability to build the principle types of vessels existing in the world today. During the Sixth 5-year Plan de China State Shipbuilding Corp. built a total of 38 types of civilian vessels of 3000 tons or more, of which 26 were newly developed in the Sixth 5-year Plan. A 50,000 ton tanker, surpassing the largest vessel tonnage to date, and a 65,000 ton tanker, a 64,000 ton general cargo ship, a 69,000 ton refined oil tanker, and a 115,000 shuttle tanker that have been built or are now under construction, have basically made fullest use of China's present shipbuilding docks. As for vessel types, development has advanced from general cargo and multi-purpose ships to multi-purpose container ships, full container ships and Ro-Ro vessels that are structurally sophisticated and that require high technology, and to special purpose vessels such as refined oil tankers, automobile ferries, and shuttle tankers. All these vessels are highly automatic. Some engine rooms are remote controlled for 16 hours, some for 24 hours, keeping crew to a minimum and reducing operating costs. Except for liquified natural gas carriers and chemical carriers, for which no orders have been received, China has built or is building the principle types of vessels in the world.

China has solved shipbuilding problems by using international advanced standards. In the past, China only built ships complying with her own and Soviet shipbuilding specifications, because in fact China didn't have much printed information on other countries' specifications. But in a few short years, China completed a fleet of ships that meet world famous maritime classification societies specifications such as British, Norwegian, American, German, French, and Japanesse; moreover, all the essential techniques, equipment, and quality in the building process have been under their strict control and obtained their approvals. In addition to having built vessels for export that fly flags of convenience, China has also built ships flying the flags of the United States, Germany and Norway, internationally known for stringent requirements for vessels flying their flags; such stringency has added greatly to the difficulty of shipbuilding. A modern ship is not only required to meet relevant international convention provisions, it must also comply with the stipulations of a particular sailing zone and a particular port. All oceangoing vessels China has exported have met these requirements. And the facts show that China is already capable of building vessels that meet any international specification, fly any flag, and sail in any sailing zone.

The quality of the vessels has also caught up with world standards. In the past, foreign merchants generally cast doubt on the quality of vessels exported by China because they were unaware of the capability of our shipbuilding industry. By having passed the international ship surveyors inspections during the building process, and especially sailing tests conducted under various post delivery conditions, China's exported vessels are now generally accepted as excellent in quality. One executive of an international classification society evaluated Chinese made vessels as "reasonable in price and excellent in quality." Many shipowners sent letters or telegrams to China expressing praise and appreciation. All their doubts and worries have disappeared, and in place they are full of confidence in the quality of China's vessels, and indicate interest in placing additional orders as soon as the shipping market rebounds. It is because ships exported by China excel in quality and because China has built a good reputation in the world market that China has attracted the world shipbuilding circle's close attention as a new vessel exporting nation.

The quality of domestic vessels is also catching up with that of exported vessels. One hundred percent of the domestic ships have been awarded for consistent improvement in product quality.

CONSTRUCTION

CONSTRUCTION BUSINESS, CAPITAL CONSTRUCTION SYSTEM ADVANCES

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 19 Dec 85 p 3

/Article by Liu Yongya /0491 3938 0068/: "Reform in Construction Business and Capital Construction System Scores Achievements, Arousing the Enthusiasm of Workers and Raising Economic Results"/

/Text/ This reporter learned the following from the recently concluded National Symposium on Reform of the Construction Business and Capital Construction Management System: During the Sixth 5-Year Plan, China's construction business and capital construction management system underwent some important reform and achieved remarkable success in many areas.

--Construction projects have practiced contracted responsibility-delegation decisionmaking power-delivery of profit combined investment responsibility system to effectively overcome corruption in unrestrained spending and eating out of the state's "big pot" which has led to a reduction in investment. The Shanghai Paotow Steelworks achieved success with this method when they started using it in 1981 during the first stage of the project. The leading comrades of the Central Committee gave a high appraisal of this method and have decided to employ it during the second phase of the project. Of the 600 projects under construction throughout China, over 300 have adopted the investment responsibility system.

--Competitive bidding has been opened up for project construction contracts, resulting in reduced construction costs and shorter construction periods. Civil construction projects started this year, as a result of competitive bidding, have on the average reduced construction costs by 6 percent and shortened construction times by an average of 20 percent.

--Design units and state-run construction units have implemented technical and economic responsibility systems and the method of establishing an amount of work required for 100 yuan of wages, linking workers income to work results. This has aroused the worker's enthusiasm and spurred the development of the design and construction business.

--Investment funds from the national budget have changed from just being allocated to being payment for goods, and have changed from being free to funds that must be repaid. These changes have strengthened the investment users' sense of responsibility and ideas on how to get results. After implementing this method, some construction projects had construction time shortened by various degrees and increased benefits from investments. The more than 30 billion yuan allocated for capital construction in this year's national budget has all been changed to be used as money for goods. The funds raised by many provinces, autonomous regions, and municipalities have also been changed from simply being allocated to being used as money for goods.

--Contracting materials and equipment out as complete sets of the supply of construction materials and market adjustments has advanced the work of material supply for construction projects.

--In the area of organizational management of construction projects, some project-contracting companies have been formed. This form of organization has resolved the situation in the past of forming teams for a project and then disbanding them after completion of work, these teams only had training one time and did not have the opportunity of continued experience. This has started a way for better organization of project development.

DOMESTIC TRADE

CAPITAL EXPORTS TECHNICAL KNOWLEDGE, IMPORTS PRODUCTS

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 4 Jan 86 p 3

[Article: Beijing Bolsters Economic and Technical Cooperation With Other Parts of the Country. Transfers More Than 2,000 Technical Achievements to Woolen Textile and Leather Industries; Brings In a Number of Well-Known, Top Quality Products Through 62 Joint Business Accords"]

[Text] A 2 January XINHUA NEWS AGENCY dispatch from Beijing has reported Beijing Municipality's vigorous expansion of lateral economic links. Economic and technical agreements concluded during the past several years have earned marked economic and social benefits. The city has entered into cooperation with 28 provinces, municipalities and autonomous regions, signing more than 1,700 agreements with them totaling more than 300 million yuan.

Beijing has followed the principles of "making the most of strengths and avoiding weaknesses, diverse forms, mutual benefit and mutual interest, and joint development." It has done a good job of balancing imports and exports, carrying out a multifaceted economic exchange of technology, talent and materials.

Beijing's strengths in production technology, managerial experience and the training of talent have been diffused outward. For several years, the city has trained more than 2,000 managerial and technical personnel in the woolen textiles, leather, paper manufacturing, food, electronics and farm machinery fields for other provinces and municipalities, and it has sent out several hundred specialists to provide consultation and guidance. It has also transferred more than 2,100 scientific and technical achievements to other places. The main Beijing Glass Manufacturing Plant sent technical personnel to help the glass manufacturing plant at Shijushan in Ningxia Province improve its technology and increase mechanization. As a result, this plant's rate for meeting specifications reached more than 90 percent; it turned losses into profits, and its products sold well throughout northwestern China. Educational and health units in Beijing also trained nearly 1,000 college students, teachers, and professional medical personnel for other jurisdictions. A number of teachers and medical personnel from Beijing also travelled to Nei Monggol, Xinjiang, Shanxi and Gansu to provide instruction and medical treatment and to spur the economic and cultural development of fraternal areas.

Initiative in putting to use the products, capital, and raw materials of other areas has hastened development of Beijing's tertiary industries. This has enlivened the production of commodities in suburban rural villages. During the past several years, Beijing has entered into joint accords with other provinces and municipalities on 62 urban services and has imported large quantities of well-known, top quality local products. Today there are 42 different restaurants in the capital offering the flavors characteristic of various areas, providing the people of Beijing with more than 11,000 different dishes. Beijing has also made agreements with some provinces and municipalities for their establishment of bases for the production of non-staple foods including aquatic products, beef and mutton, vegetables and fruits. It has brought in large numbers of fish fry and vegetables from Jiangsu, Zhejiang, Hubei and Hebei provinces that have played a major role in fresh water fish production, in evening out market prices for vegetables, and in solving the problem of vegetables for an urban population of nearly 10 million.

INDUSTRIAL PARTNERSHIPS EXPAND PRODUCTION

Shanghai WEN HUI BAO in Chinese 19 Nov 85 p 1

[Article by Ying Yan'an [2019 1693 1344]: "Lateral Internal Partnerships Highly Successful For Shanghai Economic Zone Light Industry"]

[Text] The correspondent obtained the following information yesterday: Shanghai Economic Zone light industry has scored outstanding successes in the course of carrying out lateral economic partnerships. Preliminary statistics show that during the past 2 years 2,462 enterprises have instituted economic partnerships. As a result of these partnerships, these enterprises have added 2.63 billion yuan in output value, increasing profits by 280 million yuan.

The Shanghai Economic Zone Planning Office of the State Council and the Ministry of Light Industries convened a conference in Yangzhou a few days ago to summarize and exchange experiences and to discuss the situation concerning the launching of lateral economic partnerships of light industries in the Shanghai Economic Zone. Since 1984, the bicycle, wristwatch, sewing machine, household electrical appliances, clothing, toy and food industries in the Shanghai Economic Zone light industry system have instituted widespread economic partnerships that cut across provincial and municipal boundary lines and that vary in form. There have been industrial partnerships transcending provincial and municipal boundaries that have used name-brand products as a "turnkey," and there have also been joint venture operations, designated brand production, production and marketing partnerships, division of profits from technical investment, technology transfers and technical development, and technical cooperation. Reportedly joint venture enterprises in four provinces and one city have played a more than 66 million yuan role in areas that cut across provincial and municipal boundaries. The Shanghai Municipal Light Industry Bureau provided support in the form of more than 300 pieces of advanced equipment to places outside Shanghai through economic partnerships that cut across provincial and municipal lines. Batch production of name-brand Shanghai bicycles, wristwatches and sewing machines has expanded in Jiangsu, Zhejiang and Anhui provinces. During 1985, production of Yongjiu and Fenghuang bicycles expanded by 1.19 million units and production of Shanghai name brand wristwatches and sewing machines totaled 1 million and 210,000 units respectively.

ACTIVITIES OF ECONOMIC ZONE BASED AROUND CHONGQING REPORTED

Beijing RENMIN RIBAO in Chinese 18 Jan 86 p 2

[Article by Correspondent Huang Wenfu [7806 2429 4395]: "Steady Expansion of Chongqing's Lateral Economic Partnerships. Based In the Southwest, Geared To the Needs of the Southwest, Serves the Whole Country, and Advances Toward the World"]

[Text] In the course of a comprehensive restructuring of its economic system, Chongqing City has vigorously expanded lateral economic partnerships. Today, not only is Chongqing carrying out close regional cooperation with Sichuan, Yunnan, Guizhou and Guangxi provinces in southwestern China, but it is also building long-term economic and technological cooperation with Liaoning, Gansu, Shaanxi, Qinghai, Xinjiang and Guangdong. Chongqing has signed more than 1,100 cooperative agreements of various kinds with other places, 60 percent of which have been implemented or are in process of being implemented.

Work from the southwest, serve the southwest, gear to the needs of the whole country and advance toward the world is the program Chongqing follows in the development of lateral economic partnerships. This means both an outward radiation of its own strengths and making use of the advantages others possess to remedy its own disadvantages for a steady strengthening of its own economic power and overall service capabilities while making use of the multi-functional role of its key urban economy. Chongqing has emphasized work in the following regards:

Entering into industrial cooperation with other places using Chongqing's existing human talent and the leading position of its enterprises in technology and products. Among the cooperative industrial organizations established with four provinces and regions in southwestern China by leading enterprises in Chongqing are 19 paper industry federations and leather industry societies. The Wufang Chinese Medicinal Herb Economic Cooperation Society, which was established more than 1 year ago, has had transactions totaling more than 70 million yuan. Owing to the dominant position enjoyed by name-brand products such as "Tianfu Cola", which is produced by the Chongqing Beverages Plant, 66 jointly operated branch plants were set up in 25 provinces, cities and autonomous regions throughout the country, making the beverages plant the largest one in the whole country.

Bolstering of cooperation in many regards with large and medium size cities for the gradual formation of a key urban economic cooperation network. Chongqing reached an accord with Chengdu, Kunming, Guiyang, and Nanning in southwestern China on the strengthening of economic ties and cooperation among the five cities, including the circulation of goods, cooperation in materials and goods, jointly operated enterprises, joint exploitation of natural resources, scientific and technical cooperation and jointly operated tourism. The accord also called for establishment of a joint conference of the mayors of the five cities. Recently, Chongqing together with Shanghai, Nanjing and Wuhan jointly initiated establishment of an economic cooperation society of key cities along the Chang Jiang.

To make the most of Chongqing's economic advantages, and actively support southwestern minority nationality areas and economically undeveloped areas. In 1984, Chongqing and Guang'an County in northern Sichuan Province entered into economic and technical cooperation geared to needs and reached agreement on more than 30 tasks.

MILITARY INDUSTRY MAKES FIRST PUSH TO EXPORT

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 4 Jan 86 p 1

[Article by Correspondent Chen Zhiqiang [7115 2535 1730] and Correspondent Luo Hankui [5012 3352 1145]: "Military Industry Sector Transfers Technology Abroad. To Hold First Trade Fair at Shenzhen During April. More than 1,000 Technical Achievements To Be Put on Display."]

[Text] The Chinese military industry sector, which has been a closed area for the past more than 30 years, will hold a large trade fair for the export of technology for the first time in April 1986 at Shenzhen in Guangdong Province. The fair will feature mostly the transfer of military industrial technology for civilian use and will be known as the Chinese Shenzhen Technology Trade Fair.

The more than 1,000 technical achievements to be displayed at the fair will be provided by nine trade groups connected to the Ministry of Ordnance Industry, the Ministry of Aeronautics, the Ministry of Astronautics, the Ministry of Nuclear Industry, the Ministry of Electronics Industry, the Chinese Shipping General Corporation and the PLA. Among the items displayed will be more than 130 that have won national invention prizes and national progress awards, including a miniature nuclear reactor and an operational heated and pressurized qiangzhushi [1730 3137 1709] plugging technology for stopping leaks as part of a total of nearly 100 items that meet advanced international standards.

In recent years China's national defense science and technology industrial sector has transferred large amounts of technology used in the armed forces to the civilian area, providing marked benefits thereby to all sectors of the national economy. The two technology trade fairs held in 1985 that were geared to domestic needs displayed a total of more than 16,000 items, and contract transactions totaled nearly 700 million yuan.

Reportedly numerous technical achievements of national defense industrial departments and units have not yet been displayed. The items displayed in the two trade fairs held in 1985 represented only one-tenth of total technical achievements.

Items displayed in this exhibition contain some technology offered outside the country for the first time by the military industrial sector. They relate to the nuclear, energy, communications, environmental protection, chemical industry, metallurgy, machinery, light industry, textile, building materials, food, medical treatment and agricultural fields.

This fair is to be jointly run primarily by the National Defense Scientific and Technological Commission in conjunction with the State Council Science and Technology Leadership Team Office, the State Economic Commission, the State Science and Technology Commission, the Guangdong Provincial Government and the Shenzhen Municipal Government.

The person responsible for preparing this trade fair said that in order to accommodate foreign friends and firms, plans called for the Chinese Shenzhen Technology Trade Fair to open around the time of the 1986 Chinese spring trade fair in Guangzhou.

He said foreign firms and scientific and technical groups carrying their own technology to exchange would be welcome. The Chinese national defense science and technology industrial departments will following the principles of displaying technology, facilitating the flow of information, promoting exchanges, and seeking cooperation and joint prosperity. They will establish broad relationships with foreign firms and scientific bodies and carry out technological trade and cooperation.

This fair will expand the scope of business transactions. Not only will it hand over technology, provide technical services and technical consulting, but it will also hold talks on the commissioning of research, on the tackling of key technical problems and on technical transformation activities as well as on technical cooperation joint development and joint ventures. In addition, it will discuss the contracting of project prospecting, design and construction, and the continuation of activities such as the training of administrative, managerial and technical personnel.

INTERNATIONAL GARMENT MANUFACTURERS EXHIBIT EQUIPMENT

OW131041 Beijing XINHUA in English 0947 GMT 13 May 86

[Text] Beijing, May 13 (XINHUA)--Over 60 manufacturing firms from throughout the world are displaying their garment making equipment at an exhibition that opened here today at the China International Exhibition Center.

Jia Shi, president of the China Council for the Promotion of International Trade, told XINHUA the exhibition "provides a good opportunity for Chinese and foreign garment technicians to learn from each other."

With the "improvement of the urban and rural people's living conditions, people increasingly ask for well-designed and tailored garments," he said.

Garments have also become one of China's key export commodities, generating more than U.S. $1.4 billion in 1985, according to an official of the China National Garment Industry Corporation.

China now has more than over 6,800 garment factories, he said.

To supply domestic and export markets, said the official, over the last few years China has been importing garment production lines and processing equipment from the Federal Republic of Germany, Japan and the United States.

These countries as well as others including France and Britain are displaying computerized equipment for designing, tailoring and embroidering clothes, multi-function sewing machines, packing machinery and other garment manufacturing machines.

The 7-day exhibition is jointly sponsored by the China Council for the Promotion of International Trade and SHK International Services of Hong Kong. During the exhibition, leaders of China's garment industry are expected to discuss trade and cooperative ventures with the exhibition participating firms.

MACHINE-BUILDING OFFICIAL SAYS EXPORTS TO INCREASE

OW281800 Beijing XINHUA in English 1743 GMT 28 May 86

[Text] Beijing, May 28 (XINHUA)--To boost China's exports, electrical machinery manufacturers here are looking to markets in Australia, Japan, New Zealand and the countries of North America, a high official said today.

Zhao Mingsheng, vice-minister of the machine-building industry, told a news conference today he expects industry exports to reach U.S. $4 billion by 1990, up from $1.3 billion in 1985.

Electrical machinery exports are "imperative," because of changes in the price on the world oil market, he said.

According to Zhao, so far this year government agencies have already signed electrical machinery export contracts worth $600 million.

Over the next 5 years, he said, primary export products will be machine tools, electrical generators, farm machinery, engineering equipment, motor vehicles and mining equipment.

Zhao said he expects to increase China's share of the New Zealand market with mechanized farm tools, electrical machinery, irrigation and mining equipment and machine tools.

To Japan and North America, he said, China will compete with other export nations to sell products in demand but not locally produced.

To make sure sufficient products are available for export over the next 5 years, the government will open 70 new export-oriented enterprises and give more decision-making powers regarding foreign trade to another 130 state-owned operations.

The industry now exports more than 300 products to 130 countries and regions, but its share of the world market remains small.

As it grows, Zhao said, China will develop an international marketing and service network.

BOHAI BAY 'ECONOMIC RING' PROMOTES INTERREGIONAL COOPERATION

OW300628 Beijing XINHUA in English 0601 GMT 30 May 86

[Text] Tianjin, May 30 (XINHUA)--Fourteen cities and prefectures along the coast of China's Bohai bay have organized themselves into an economic cooperation organization under the current policy of encouraging inter-regional cooperation.

The Tianjin-based organization, called "the Bohai Bay economic ring," consists of five cities and prefectures in Liaoning Province, three in Hebei, five in Shandong and the Tianjin Municipality.

Economists describe the areas along this section of the coast in northern China as constituting the country's "golden necklace," in that they are among the best developed areas in China.

Dalian and Yingkou in Liaoning, Qinhuangdao in Hebei, Yantai and Qindao in Shandong as well as Tianjin are important foreign trade outlets and industrial centers. Tangshan in Hebei is a major coal mining area, producing about 20 million tons a year.

The Bohai bay economic ring, set up in Tianjin Thursday, aims at coordinating the efforts of the participating areas to expand foreign trade, according to a spokesman for the organization.

Projects planned for the objective include exchange of information, coordinating the use of ports, and joint production of export goods.

The authorities of the participating areas will also work together to develop natural resources by setting up production centers of industrial raw materials and aquatic products. Meanwhile, they will supply each other's needs.

FUJIAN'S ROLE IN ATTRACTING FOREIGN TECHNOLOGY SKETCHED

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 4 Jan 86 p 3

[Article by XINHUA NEWS Correspondent Wang Weizhong [3769 3555 0022]: "Fujian Province Builds a Multi-Level System For Opening Up to the Outside World. More Than 10 Foreign Trader Privately Funded Enterprises and More Than 600 Joint Enterprises Come Into Being. Industrial and Agricultural Product Exports Sent to 121 Countries and Regions"]

[Text] One after another passenger aircraft from Beijing, Shanghai, Guangzhou, Hong Kong, Nagasaki and Manila land safely at Xiamen and Fuzhou, and cargoes in a steady stream enter Dongdugang in Xiamen. It is possible to pick up a telephone in Xiamen and deal directly with all the country's major cities as well as with Hong Kong, the United States and Japan.

Fujian Province, which is one of the earliest provinces in the country to have opened the door to the outside world, has an economic structure that has gradually changed from the closed to the open kind. From its axis along the coast, it radiates both overseas and to the interior of the country. Now Fujian has taken the first steps in establishing a multi-level, multi-function system that is open to the outside world and that includes the Xiamen Special Economic Zone, the open city of Fuzhou, the Fuzhou Economic and Technical Development Zone and the southern Fujian "triangular" open economic zone. More than 20 provinces and autonomous regions as well as the Ministry of Aeronautics, the Ministry of Astronautics, the Ministry of Coal, the Ministry of Nuclear Industry, and the Ministry of Electronics Industry plus eight noted institutions of higher education have established offices in Fujian to promote cooperation in the fields of economics, technology, skilled people and information. More than 128 countries and regions have economic intercourse with Fujian Province.

In the process of carrying out the open door policy, the economy of Fujian Province has begun to take off. During the past 5 years the gross output value of the province's industry and agriculture has increased by about 10 percent each year, and total financial revenues have exceeded the Sixth 5-Year Plan by 29 percent. Agricultural and industrial products are being exported to 121 countries and regions including Hong Kong, Japan, the Federal Republic of Germany, Malaysia and Sweden. In 1985, Fujian exceeded its foreign trade export plan for the whole year 2 months ahead of schedule.

Efforts by Fujian Province in recent years to invest in the building of airfields, harbors, communications, power stations and such basic facilities have begun to bear fruit. In addition, the training and importation from elsewhere of talent in various fields has also shown very great advances. They have built long-term relationships for cooperation in skilled people with institutions of higher learning such as Qinghua University, Fudan University and Tianjin University. In recent years, Fujian Province has brought into the province more than 3,000 people skilled in various fields.

The fine climate has attracted large numbers of investors. Since the opening to the outside world, the province has attracted more than $700 million in foreign investment. Foreign traders who have made investments come from more than 10 countries and regions. The field of investment has gradually expanded from the former clothing, electronics and tourism industries into energy, communications and fine chemical industries. Today more than 600 Chinese and foreign joint venture and cooperative enterprises and more than 10 enterprises independently funded by foreign traders have made their appearance in Fujian.

Simultaneous with Fujian Province's attraction abroad has been an enthusiasm for providing a "window" on the outside world for all provinces, municipalities and autonomous regions as well as for all departments of the central government. Today 7 provinces, municipalities and autonomous regions, 16 cities and 15 central government units have established offices in the Xiamen Special Economic Zone.

FOREIGN BANKING INSTITUTIONS INCREASE IN GUANGDONG

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 4 Jan 86 p 3

[Article by Wang Qiang [3769 1730]: "Spurt in Guangdong's Foreign Finance and Banking Activities. Foreign Banks Have Set Up 41 Finance and Banking Institutions. Eight of the World's 10 Large Banks Have Set Up Organizations"]

[Text] During 1985 a total of 20 foreign banks set up external finance and banking institutions in Guangdong. This is nearly the total of external finance and banking institutions set up by foreign banks in Guangdong Province during the past 4 years. Four of the 20 foreign banks that established external finance and banking institutions in Guangdong during 1985 were among the top 10 world banks (in terms of total assets) in 1984. Today eight of the world's 10 leading banks have established offices or agents in Guangdong. They are the Japanese Dai Ichi Kangyo Bank, the Japanese Fuji Bank, the Japanese Sumitomo Bank, the Japanese Mitsubishi Bank, the American National City Bank, the Japanese Sanwa Bank, the French Banque Nationale de Paris, and the French Banque Credit Lyonnaise.

As of the end of 1985, foreign banks having external financial and monetary institutions in Guangdong totaled 41. Shenzhen had most with 21. Next came Guangzhou and Zhuhai.

In accordance with Chinese People's Bank regulations pertaining to methods of regulating overseas Chinese and foreign banking and financial institutions, foreign banks are permitted to establish branch banks or branch institutions in special economic zones such as Shenzhen and Zhuhai and to carry out banking and financial activities within a certain sphere. However, in Guangzhou and other places, they are permitted only to set up officers for the purpose of liaison and to provide advice to clients.

SHENYANG PLANS INCREASE IN EXPORTS, INVESTMENT IN INDUSTRY

HK270400 Hong Kong SOUTH CHINA MORNING POST (BUSINESS NEWS supplement) in English 27 May 86 p 5

[By Gene Linn, recently in Shenyang]

[Text] The city of Shenyang, China's biggest machinery manufacturer, is applying its enormous industrial muscle to the nation's push to increase exports and investment.

The drive will spawn numerous changes in this city of 5.3 million people, which is the capital of Liaoning Province. The city's industrial production amounts to 16.2 billion yuan (about HK $39.36 billion). It is also a transportation centre, as railroads and highways funnel from the northeast to the port at Dalian.

The city has branch offices of 14 national import/export corporations. Shenyang also recently gained the power of a province in economic planning.

"That's one less layer of red tape for businessmen," said Mr John Parker, economic officer in the U.S. Consulate in Shenyang.

City authorities can approve projects involving up to U.S. $5 million in foreign investments or imports.

Another change is the plan to increase light industry's share of production from 35 to 40 per cent.

"We emphasize light industry because the profit is higher and there's greater export potential," said Mr Tong Lianyi, an official at Shenyang's Foreign Economic Relations and Trade Bureau.

"It's essential to reach international markets."

Factories that make less profit from exports than from domestic sales will be eligible for compensation by the government, Mr Tong said.

The city will also set up factories expecially for exports, such as the First Machine Tool Factory.

The emphasis for exports this year will be on electrical machinery, machine tools, electrical cables, valves and water pumps.

Shenyang already exports large quantities of textiles, vitamins, fur coats, silk flowers and pottery.

The city will give light industrial factories more foreign exchange to encourage them to improve their products and export more, said Mr Tong.

The central government offers further encouragement by returning a larger share of foreign exchange earned by Shenyang factories.

Last year, Shenyang's share from individual factories rose from 20 to 25 per cent each. And state investment rose from 1.4 billion yuan in 1984 to 1.6 billion last year.

Foreign exchange investment during the period climbed from U.S. $30 million to $100 million--despite the overall restrictions that China imposed to protect dwindling reserves.

"The central government is restricting foreign exchange investment in ordinary construction, such as housing," said Mr Jin Sen, chief of the Comprehensive Section of the Shenyang Municipal Planning and Economics Committee.

"Investment for energy and transportation projects has not been cut."

Shenyang plans to supplement state investment with overseas funds. From 1983 through October last year the city agreed to 383 projects involving U.S. $270 million in foreign investment.

Mr Tong said the 11 joint ventures in operation are all profitable. Future terms will be more favourable for overseas investors, but the final terms have not been set.

Shenyang has applied to Beijing for permission to build an Economic and Technical Development Zone offering preferential treatment.

"If that's not approved, the policy will be loosened somewhat," said Mr Jin.

"It will be almost the same as the 14 open coastal cities."

Officials said present joint ventures in services and light industry will run for 10 to 15 years.

Projects in other areas might be in effect longer.

Joint ventures must export 70 to 75 per cent of their production. Shenyang emphasises renovation of old enterprises, but also hopes to attract investment in new fields such as scientific instruments and vacuum technology. The city also seeks investment to help exploit the area's abundant natural resources, according to Mr Hao Yongzhi, chief of the provincial National Land Division.

These resources include coal, iron, jade, marble, magnesite, cobalt, molybdenum titanium and copper.

One nearby region has promising diamond deposits.

As is the case elsewhere in China, Japanese businessmen are taking the best advantage of opportunities in Shenyang.

The Japanese have something extra going for them here and in the rest of Liaoning: familiarity gained during decades of occupation until the end of World War II.

Liaoning's imorters have been attracted to low prices offered by the Japanese, but the Chinese are wary of letting Japan eliminate the competition. Hong Kong businessmen also have a foothold in Shenyang. Two of the six foreign representative offices in the city are from Hong Kong (the others are Japanese).

Foreign businessmen face a number of problems in Shenyang.

The nightlife is virtually non-existent, they said, and top-flight hotel rooms are scarce. Transportation is below par. There is no international airport and no direct flight from Hong Kong. Shenyang also is a bottleneck for passenger and freight rail traffic.

Not surprisingly, transportation is receiving special attention for development along with communications.

FOREIGN TRADE AND INVESTMENT

BRIEFS

BOHAI GULF BUSINESS EXHIBITION--Tianjin, June 2 (XINHUA)--An international exhibition of business opportunities around the Bohai Gulf in northern China will be held in Tianjin from November 15 to 20, it was announced today. The Bohai area is a major industrial and agricultural production center, said Xia Muyu, manager of the Tianjin International Exhibition Company. It is rich in natural resources. Foreign business people from more than a dozen countries and regions will participate in the exhibition. And enterprises from the port cities of Dalian, Qinhuangdao, Tianjin, Yantai and Qingdao will also take part. During the event, business talks will be held on the establishment of sino-foreign joint ventures and co-operative enterprises, and the import of advanced technology and equipment. The exhibition will be sponsored by the Tianjin branch of the China Council for the Promotion of International Trade and the China International Trade Fair of Hong Kong. SPECIAL ECONOMIC ZONES

SHENZHEN TO OFFER MORE TAX CONCESSIONS

HK130733 Hong Kong SOUTH CHINA MORNING POST (BUSINESS NEWS supplement) in English 13 May 86 p 1

[By Paul Sham]

[Text] Shenzhen is shortly to offer more tax concessions to foreign banks to maintain their interest in setting up branch offices, according to banking sources.

Because of spending cuts by authorities and companies in the Shenzhen special economic zone and high banking overheads there, many foreign banks have retreated from their previous enthusiasm for setting up branch offices, sources said.

Recent implementation of the second border separating Shenzhen from the rest of China, and the central government's ambiguous attitude towards the zone's development, have also dampened foreign banks' interest.

The sources added that they had been told by Chinese banking officials that the tax concessions, which have been circulated among foreign banks since March, will be officially announced very soon.

Concessions will include a further extension of the 5 year exemption of banks from the 3 per cent consolidated industrial and commercial tax. The exemption was introduced last year.

In addition, the sources said, banks will be exempted from the controversial 10 per cent interest-withholding tax on borrowings from foreign sources, except on any portion of interest above the international interbank rate.

Even with the exemption, the sources said, Shenzhen banks' average profit on loans of around 0.3 per cent is still very thin.

LABOR AND WAGES

BRIEFS

LABOR SERVICE COMPANIES' PERFORMANCE--Beijing, 5 May (XINHUA)--According to statistics, the 45,000 labor or so service companies of all types and at various levels in the country found employment for over 6 million people last year, replacing the jobs of more than 10 million. According to information released at a current national meeting of directors of labor and personnel departments or bureaus, the development of labor service companies has been characterized by the following three trends: First, they have extended into towns and townships. Labor service companies founded last year are mostly run by counties, towns, and townships. They have found jobs for many non-agricultural personnel, thereby effectively guiding the flow of labor forces from the rural to the urban areas. Second, their economic efficiency has been remarkably enhanced. The number of jobs placed by the labor service companies last year increased 10.2 percent over the previous year, but their output value, total sales, and labor service revenues rose by nearly 40 percent, while profits were up by more than 50 percent. The per capita output value by labor service companies at various levels in Shanghai rose from some 4,000 yuan to over 12,000 yuan. Third, the quality of pre-employment training has also been improved. Currently, labor service companies run a total of some 1,200 job-training centers and 470 field-training farms and shops. They are capable of training 600,000 people annually. In Jilin Province, the ratio of those who found jobs after undergoing training increased to 88 percent last year. PAPER CALLS FOR END TO CUSTOM OF BRIDE PRICE

OW231445 Beijing XINHUA in English 1415 GMT 23 May 86

[Text] Beijing, 23 May (XINHUA)--Asking for betrothal gifts, a feudal custom left over from old China, must be thoroughly eliminated in order to ensure that China's rural youths enjoy the right to choose their spouses of their free will.

The newspaper, CHINESE WOMEN, today appealed to authorities at various levels to pay attention to the problem and take "effective measures" to resolve it.

Based on a survey earlier this year, the paper reported some "representative" cases involving such gifts of up to 10,000 yuan.

In the past five years, it said, the income of the rural population has increased 110 percent, but the bride price has soared about ten-fold on the average. The price does not cover the building cost of new homes and the wedding expenses, the paper added.

The survey was conducted by the paper, together with two youth magazines. It shows that to many parents, getting a son married is an "unbearable" burden.

In old China, the most fearful thing was to have a son pressed-ganged into the (Kuomintang) army," the paper quoted some older peasants as saying. "Now, it is to have a son married."

The paper and the two magazines issued a questionnaire on marriage in the countryside, and have so far received answers from 4,000 people all over the country, in addition to 1,000 letters on the same questions.

Ninety-eight percent of those who answered the questions support the free choice of spouses, CHINESE WOMEN said. For the majority, their primary concern is whether their future husbands or wives are educated and have moral integrity.

The financial conditions of the families of their future spouses are only the eighth consideration, the paper said.

Most girls are of the opinion that they don't care much about money so long as their future husbands are well educated and have production skills, it reported. "This shows a healthy trend of thinking among China's rural youths, a trend resulting from the current policies of encouraging rural prosperity," the paper noted.

But asking for betrothal gifts often frustrates the "rightful" desire of young people to seek true love, and this has resulted in many social problems.

In addition, many parents have no money to expand production when they have to spend all their savings--and sometimes have to borrow--in order to get their sons married.

CONTEST EMPHASIZES IMPROVING CHILD REARING

OW261619 Beijing XINHUA in English 1509 GMT 26 May 86

[Text] Beijing, 26 May (XINHUA)--A primary-school girl asked her mother to accompany her to the cinema. Her mother hesitated for a while and told her daughter she'd better go there with her little friends.

The mother, Lou Fang, said if this had happened a month ago she would have agreed without hesitation, but a contest on child-raising had helped her to realize she must let her only daughter be independent.

Mrs. Lou, a factory worker in her 30's, was one of the 10 who won the first prize at the contest.

More than 100,000 Beijing people took part in the contest which resulted in 10 first, 50 second and 100 third prize winners here today. Among the 10 first-prize winners there were four young mothers, five young fathers and one grandmother. The contestants included workers, farmers, teachers, doctors and nurses.

On 5 April, the BEIJING EVENING NEWS published the questionnaire for the contest. The circulation increased to one million that day. There were 100 questions ranging from child education and psychology to child hygiene and care. The questions included such things as "what should be included in the children's everyday diet? and how many green vegetables should a child eat every day?"

One multiple-choice question is designed like this: "a two-year-old has a habit of nibbling between meals, the best way is (1) to buy her between-meal snacks as little as possible, (2) to tell the baby it is harmful to nibble between meals, (3) to put the between-meal snacks where she can't reach them."

The contest was aimed at popularizing the common knowledge of raising and educating children and guiding parents to foster children in a correct way, according to Lu Chang, vice-chairwoman of the Beijing Women's Federation.

It is important to the state, society and families to help all parents understand how to raise their children scientifically, she said, now that the country encourages the one-child family policy for most urban residents.

In Beijing, as elsewhere in China, many parents hope their only child will grow up healthily but know little about how to raise them scientifically.

The activity was sponsored by the Beijing Women's Federation, the Beijing Family Education Research Association and three other units.

The answers to the questions will come out in two magazines GUIDE FOR CHILDREN and WOMEN AT HOME AND ABROAD to be published in July.

POPULATION

BRIEFS

BEIJING'S AGING POPULATION--Beijing, 25 May (XINHUA)--Beijing will become an "aging city" by the year 2000, 10 years earlier than the whole country, today's overseas edition of PEOPLE'S DAILY reported. According to the 1982 population survey, 8.6 percent of the city's population are over 60, bordering on the 'aging' status, and by the year 2030, the paper said, the number of people over 60 will increase to 3,154,000, or 28.5 percent of the city's population. Meanwhile, the people below 60 will decrease drastically under the present population policy. According to the standard set by UN organizations, a person who is above 60 years old is regarded as an old person. A country or region where 10 percent of the population are over 60--or 6 percent over 65--falls under the category of "aging nation". The paper said that the aging of Beijing's population is closely connected with the birth rate, which is decreasing gradually in the past years. And the lower death rate and longer lifespan, as well as the immigration of young and middle aged educated people are attributable to the aging of Beijing's population. TRANSPORTATION

NORTH-SOUTH RAILWAY SECTION BEING DOUBLETRACKED

Beijing TIEDAO ZHISHI [RAILWAY KNOWLEDGE] in Chinese No 5, 28 Sep 85 pp 2-3

[Article by Zuo Wenyuan [1563 2429 3220] and Li Zhenxing [2621 2182 5281]: "Double Tracking of the Hengyang-Guangzhou Section of the Beijing-Guangzhou Railroad"]

[Excerpts] The Hengyang-Guangzhou section of the Beijing-Guangzhou Railroad, which traverses Hebei, Henan, Hubei, Hunan and Guangdong provinces, is in process of being double-tracked. The Hengyang-Guangzhou section starts in the north at Hengyang and goes through Chenzhou, Shaoguan and Yingde cities southward to Guangzhou, a distance of 542 kilometers. It intersects with the Hunan-Guangxi line at Hengyang; at Guangzhou, it connects with the Shiweitang-Foshan-Sanshui line and the Guangzhou-Kowloon line. It is the major artery in China's southern railroad network. Double-tracking of this section of the line will rapidly increase the transportation capacity of the entire Beijing-Guangzhou Railroad and will play an important role in development of the national economy, in foreign trade, and in tourism.

A Brief History of the Construction of the Line

The Beijing-Guangzhou Railroad was formed by connecting the former Beijing-Hankou and Guangdong-Hankou lines, which run a total of 2,324 kilometers. It was one of the earliest railroad lines built in China. The former Beijing-Hankou line was known as the Lu-Han (Lugouqiao to Hankou) Railroad and was 1,214 kilometers long. Work began on the building of the the south and north sections of the line in 1897, and in January 1898, the section of the line between Lugouqiao and Baoding was opened to traffic. In 1900 when the Eight-Power Allied Forces occupied Beijing, the railroad began to be extended to Zhengyangmen in Beijing. In April 1906, the entire line from Beijing to Hankou was completed and opened to traffic. The former Guangdong-Hankou line (including the Hengyang-Guangzhou section) was 1,110 kilometers long. Construction was begun on three different sections of it in 1901, and in 1936 the entire line was completed and opened to traffic. It had been 36 years in building. With the construction in October 1957 of the bridge across the Chang Jiang at Wuhan, the Beijing-Hankou and the Guangdong-Hankou lines were connected, and in November of that same year the name was changed to the Beijing-Guangzhou line. Prior to liberation, inasmuch as the former Guangdong-Hankou line had depended on foreign capital for its construction, and materials had come from the United States and Great Britain, standards along the line were not uniform. Equipment specifications were a jumble and outdated; various technical criteria were antiquated; trains traveled at slow speed; and passenger and freight volume was not large. Following liberation, double-tracking began in 1954, and by 1971 the 1,169 kilometer distance between Beijing and Hengyang had been double-tracked. The remaining section running from Hengyang to Guangzhou remained single-tracked.

Materials and Foreign Trade

The Hengyang-Guangzhou section passes through the Nanling region where Hunan and Guangdong provinces meet, as well as through the Hengyang basin and along the edge of the Zhu Jiang delta. The line follows two major waterways, the Xiang Jiang and the Zhu Jiang where the land is fertile, rainfall copious, the climate temperate, and both agricultural products and lumber resources are plentiful. The economic area through which the line passes contains minerals, including coal, zinc, lead and wolfram. Coal transported from the stations at Laiyang and Sandu amounts to more than 1 million tons annually. Metallic ores carried from Maba Station and non-metallic ores hauled from Dongguapu station amount to more than 800,000 tons annually. Since China instituted an open door policy toward the outside world, in particular, simultaneous with "attracting into" China has been "internal linking," i.e., the use of inland raw materials and primary products for fine processing so that products are provided for export only after value has been added to them; consequently the volume of foreign trade goods shipped is very large.

The Shenzhen, Zhuhai and Shantou special economic zones in Guangdong Province, as well as the four cites and regions open to the outside consisting of Guangzhou, Zhanjiang and the Zhu Jiang delta plus Hainan Island, constitute one-third of the country's cities and regions opened to the outside world. Guangzhou also neighbors Hong Kong and Macao. Its special geographic position makes the Hengyang-Guangzhou section Guangdong Province's only major land route to the outside world. As trade and tourism have developed, the volume of passengers and freight handled by this railroad has grown dramatically in recent years.

Overview of Double-tracking Project

Double-tracking of the Hengyang-Guangzhou section began in 1958 with surveying, designing and construction that progressed in fits and starts. In 1982, work was resumed.

This section of the line was designed as a first class trunk line with a gradient of no more than .006 and a minimum curve radius of 800 meters, or 600 meters in difficult sections. Station arrival and departure galleries will have an effective length of 850 meters at the outset with provision to lengthen them to 1,050 meters. Between Chenzhou and Shaoguan, electric locomotives will pull trains. On the section between Hengyang and Chenzhou and on the section between Shaoguan and Guangdong, steam locomotives and diesel engines will pull. Automatic blocking is used throughout the line, and it is estimated that traffic capacity will be 30 million tons or more per year.

The double-tracking project between Hengyang and Guangzhou totals 553.6 kilometers in length. It is composed of the Hengyang hub, the Guangzhou hub and the sections between Hengyang and Shaoguan and between Shaoguan and Guangzhou. New building and rebuilding of station areas along the whole line plus building of a road bed between the two areas requires the removal of 55.71 cubic meters of earth and stone, and 710,000 cubic meters of masonry earthworks will be needed. There are single-tracked and double-tracked tunnels totaling 49.5 kilometers in length, including the 14.295 kilometer long Dayao Shan double-tracked tunnel, the 6.043 kilometer long Nanling tunnel and the 3.078 kilometer long Leigongjian tunnel. There are also 112 single-tracked, double-tracked and multiple-tracked large and medium size bridges; 896 kilometers of main line tracks and 401 kilometers of station tracks, and 1,573 switches. Additionally, electrified multiple tracking is to be done on the 155 kilometers between Chenzhou and Shaoguan. This is a fairly daunting project.

Arduous Construction Conditions

The performance diagram for the single-track line between Hengyang and Guangzhou calls for 48 passenger and freight trains per day and night. The double-tracking of a line while maintaining regular traffic and in a situation of increase rather than decrease in traffic volume is unheard of in the improvement of old railroad lines in China.

Double-tracking requires the blasting of a large amount of rock alongside the existing line, which poses a threat to traffic safety. After repeated study, experts selected 12 work sites for testing controlled blasting, bringing down 420,000 cubic meters of rock. At one dangerous work site, Bureau No 5 successfully innovated the "steel rail fence" method of protection, implanting upright steel rails to form a fence along steep slopes to prevent the dynamited rocks from tumbling down to the neighboring operating line. In addition, controlled blasting was carried out at 95 work sites to remove a total of 1.57 million cubic meters of rock during the short periods in between the frequent passing of trains. This project was extremely daunting and somewhat like pulling a tooth from a tiger's mouth.

A large amount of tearing down and removal of buildings is required for the rebuilding and expansion of stations. Because of the severe disturbance this causes train traffic, construction work at each station has to be carried out in several transitional stages. Transitional plans were worked out through repeated discussion, with design, construction and transportation being closely coordinated and treated seriously before taking effect. A vertical shaft flooded at Banguao during construction of a tunnel through the Dayao Shan, and in the course of building a tunnel through Nanling, a large karst cave was uncovered out of which flowed mud and water. Experts gathered at these two work sites to study plans for tackling the situations. They decided on a parallel heading at the Dayao Shan tunnel to drain the gushing water away from the tunnel cavern. At the Nanling tunnel, they used the "chemical thickening" method and the "congealing" method to solidify the mud so digging could continue.

Initial Benefits From the Project

In order to upgrade as quickly as possible the traffic carrying capacity of the Hengyang-Guangzhou line, it was decided in 1982 that the line should be improved even before the tunnel was cut through the Dayao Shan so that the amount of freight coming into the Pingshi Station on the border between Hunan and Guangdong provinces could be increased from the 11 million tons of 1982 to 15 million tons in 1984, an increase of 400 tons. Acting in accordance with the principle of stage by stage construction for stage by stage benefits, arrangements were made first for construction that would increase traffic by 200 tons between 1982 and 1984. As work was completed and the line was put in service at the work sites where improvements had been made, transportation capacity rose markedly. Freight coming into Pingshi Station increased from 10,953,000 tons to 13,375,000 tons. Foreign trade exports shipped from the Hengyang-Guangzhou section through Shenzhen increased from 1,254,000 tons in 1981 to 1,533,000 tons. Comparison of the 1981 and 1985 traffic diagrams shows an increase in passenger trains from 8 to 11 and of freight trains from 23 to 28, equaling a 4 million ton increase in the volume of transportation.

Even so, the demand for transportation could not be satisfied. Hunan Province's plans called for the passage of 20,639 freight trains through Pingshi Station during the first quarter of 1985, but actually only 12,273 trains were dispatched for only 59 percent fulfillment of plan. Hunan Province's plans for exports of foreign trade goods during the same period called for 3,336 trains to pass through the Pingshi Station, but actually only 2,390 trains passed for fulfillment of 71.6 percent of plan. Passenger transportation problems are still extremely great. At the present time, for example, passenger train numbers 5 and 6, numbers 243 and 244 and numbers 161 and 162 daily carry double the number of passengers for which they were designed. During the lunar New Year in 1985, daily passenger traffic averaged 275,000, and peak period passenger traffic was 361,000. It is hoped that the foregoing contradiction between traffic volume and traffic capacity will gradually be solved during 1988 in the process of double-tracking the Hengyang-Guangzhou line.

XINJIANG DECIDES TO CHECK NUMBER OF VEHICLES

HK120612 Urumqi Xinjiang Regional Service in Mandarin 1200 GMT 8 May 86

[Text] The regional people's government recently decided to stop increasing the number of trucks, passenger cars, and sedans within the next 2 years. All vehicles made by the region will be allocated for replacing old ones.

The decision says: For the next 2 years, no department or unit will be allowed to assemble or add additional motorcars or to purchase old motorcars from other provinces or regions. Nor are they allowed to use the scrapped motorcars. The transport supervision and oil industry departments must guarantee quality of the work. In the next 2 years, the region's establishment and expansion of factories, mines, and enterprises, as well as railway, highway, and other projects will include no investment in the motorcar industry. All motorcars needed by the projects will be handled by the construction departments at the upper level through internal readjustment, or by arranging part of the transport work to the local transport enterprises.

The regional government urged the relevant departments to give full play to the leading and major roles of the region's state-run construction and transport enterprises. They should do well in supplying key materials, providing passenger services, and transporting grain, petroleum, timber, chemical fertilizer, and important materials. Transport departments at all levels must also guide and organize the work of individual transport households. They should give play to their role in the industry.

TRANSPORTATION

BRIEFS

LARGE AIRPORT IN YUNNAN--Kunming, 25 Apr (ZHONGGUO XINWEN SHE)--A large airport with facilities to accommodate Boeing 737's will be built in Xishuanbanna, a famous scenic spot in Yunnan. The site of the airport will be in a suburb a dozen kilometers away from Jinghong, capital of the Xishuangbanna Dai Autonomous Prefecture. At present, various types of preparatory work such as surveying, drilling, surfacing, and so on are being carried out. It is expected that the construction of the runway, airport building, and so on will be started at the end of this year or early next year and will be completed in 2 years. Since Xishuangbanna was opened to the outside world, foreign tourism has sharply increased. In 1984, it received 1,700 tourists, while in 1985 it received 3,400 tourists. During this year's water-sprinkling festival of the Dai nationality, nearly 1,000 tourists came to visit Jinghong. [Text] [Beijing ZHONGGUO XINWEN SHE in Chinese 0423 GMT 25 Apr 86] /8309

SHANXI COAL STOCKPILE--Taiyuan, May 13 (XINHUA)--Shanxi, China's leading coal-producing center, is expanding its transportation system to solve the problem of excessive coal stockpiling, according to Wang Senhao, governor of the province. In addition, collective units and individuals, encouraged by the provincial government, will build railways totalling 490 km and maintain highways, the governor said. The province plans to build five local railways totalling 514 km and 549 km of highways alongside the state plans for the transport system between 1986 and 1990. Shanxi's coal output has increased by 18 million tons a year since 1980 to reach more than 200 million tons last year. But owing to transport problems, more than 50 million tons of coal and other materials are lying idle. The governor said the plans for the next few years will bring the province's annual rail transportation capacity to 330 million tons by 1990--138 million tons more than in 1985--and the highway transportation capacity to more than 200 million tons, up 80 million tons. [Text] [Beijing XINHUA in English 0638 GMT 13 May 86 OW] /8918

XIZANG ROAD TRANSPORT, PRODUCTION--Ihasa, May 26 (XINHUA)--Roads in Tibet have been improved over the past few years to encourage commodity production and transport, according to the region's Communications Bureau. The government of the Tibet autonomous region has installed a road network fanning out from Ihasa, the capital of the region, to Tibet and neighboring provinces. Bus routes now extend more than 10,000 kilometers. "We dispatch more than 50 buses to all parts of the region," said an official of the Tibet Passenger Transport Company. "They are shuttling between seats of various prefectures and county towns and pick up passengers at the sign of a wave." "The buses are equipped with oxygen supplies and heating systems," he added. Before 1951, when the region was liberated peacefully, there were only five narrow paths for postal services in Tibet, which covered 1.2 million square kilometers. [Text] [Beijing XINHUA in English 0709 GMT 26 May 86 OW] /8918

SICHUAN, ANHUI HIGHWAYS, WATERWAYS--Beijing, May 30 (XINHUA)--Sichuan and Anhui provinces will expand highway and waterway systems to boost commodity circulation and attract more tourists in the 1986-90 period, the ECONOMIC DAILY reported today. The paper quoted an official of the Sichuan Provincial Bureau of Communications as saying that the province will build 10 trunk highways totalling 1,700 kilometers, and widen and asphalt highways linking 16 large and medium-sized cities in the province. Meanwhile, the Anhui provincial government will invest a total of 200 million yuan in harnessing 7 main river channels, and building and upgrading 27 ports and 4 ship locks in the coming 5 years. Upon completion, these facilities will help increase its waterway transport and turnover volume by 30 percent over 1985; its ports and docks will be able to handle 80 percent more cargo. OVERSEAS CHINESE INVESTMENT LAWS REVISED

OW231812 Taipei CNA in English 1446 GMT 23 May 86

[Text] Taipei, May 23 (CNA)--The Legislative Yuan Friday passed the revision of the statutes governing investments by Overseas Chinese at the third reading to ease the restrictions on foreign exchange remittances by Overseas Chinese investors in the Republic of China.

In the revised statutes, capital gains of Overseas Chinese-invested companies may be remitted abroad after 1 year's business operation is completed. The former regulation required 2 years.

Also according to the current Article 267 of the company law, when a company's paid-in capital is increasing, it must reserve 10-15 percent of the new shares for purchase by its employees. In order to encourage foreign investments in Taiwan, Overseas Chinese-invested companies are given the privilege of ignoring this rule, the new statutes provide.

Commenting on the passage of the revision, legislator Liu Chin-yueh, convener of the Regulation Revision Committee, said that the move will not only help attract more investments from Overseas Chinese, but will also contribute significantly to the government's efforts in image-building among ethnic Chinese abroad.

According to government statistics, approved investments by Overseas Chinese made from January 1982 to March of this year totaled 1,662 cases with investment capitals amounting to nearly U.S. $1.21 billion.

FINANCE MINISTRY REPORTS CONTINUED TRADE SURPLUS

OW240605 Taipei CNA in English 0240 GMT 24 May 86

[Text] Taipei, May 19 (CNA)--The Republic of China's trade surplus in 1986 had accumulated to U.S. $4.6 billion as of May 10 due to the booming exports of the past few months, an official with the Finance Ministry said Monday.

The official said according to customs statistics, the nation's imports from January 1 to May 10 increased by 4.22 percent from the same period of last year to U.S. $7.8 million while exports increased by 15.53 percent to U.S. $12.4 billion.

The exports in April registered the highest monthly growth in the past few years due to the fluctuations of foreign exchange rates and the fall of international oil prices, the official said. Among various export categories, metal products, transportation facilities, plastics products, textiles, wooden products and machinery even set the highest monthly record in terms of their value in April, he said.

Thanks to the booming exports, the nation's exports in April also showed an increase of 3.4 percent as compared with the same months of last year, he added.

Meantime, Economics Minister Lee Ta-hai said that the government is studying the possibility of allowing the people in this nation to buy stocks of renowned foreign companies through several monetary organizations designated by the government to alleviate the pressure incurred by the nation's excessive foreign exchange reserves which has hit U.S. $2.6 billion in May.

Lee, worried that the excessive foreign exchange reserves will constitute a great pressure to induce inflation in this nation, has ordered concerned agencies to study ways of encouraging the private sector and state-run enterprises to increase their investments in other countries.

BRIEFS

AD HOC TRADE COMMITTEE--Taipei, May 24 (CNA)--The Ministry of Finance (MOF) and the Ministry of Economic Affairs (MOEA) decided recently to set up an ad hoc committee to establish the temporary admission carnet system in a bid to promote bilateral trade between the ROC [Republic of China] and other nations. Meanwhile, the China External Trade Development Council (CETDC) has been delegated to issue the admission certificates. The said system, which was set up in 1962 by the Customs Corporation Council [CCC] was founded to promote trade and culture among over 40 member nations. Under the system, a country's commodities and samples being sent to another nation for the purpose of display or promotion are exempt from taxes if both nations have signed an agreement to this effect or are both CCC members on condition that such goods are sent back following marketing review activities. Currently, South Africa and Korea have each agreed to sign temporary admission and carnet system agreements with the ROC to facilitate bilateral trade. FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

HEBEI CONGRESS STANDING COMMITTEE ISSUES WORK REPORT

SK300920 Shijiazhuang HEBEI RIBAO in Chinese 8 May 86 pp 1, 3

[Work report given by Sun Zhiguo, chairman of the Hebei Provincial People's Congress Standing Committee, at the fourth session of the sixth provincial People's Congress on 30 April 1986]

[Excerpts] Fellow deputies:

Entrusted by the provincial people's congress standing committee, I would like to deliver a report on the work done in the period since the third session of the sixth provincial people's congress.

Since the third session of the sixth provincial people's congress, the standing committee, under the leadership of the provincial CPC committee, has played an active role in further enhancing the building of democracy and legal systems, promoting the smooth progress in the drive to conduct reforms, ensuring the healthy development of the drive to conduct reforms, consolidating the outstanding results scored in the drive to conduct reforms, and pushing forward the program of building the two civilizations in the province by taking the spirit of the National Conference of Party Delegates as guiding ideology, following the demands set forth in the proposals made bythe central authorities with regard to formulating the Seventh 5-Year Plan for economic and social development, proceeding from the party's general target and task, vigorously exercising the function and power given by the Constitution and the "Organic Law" for local congresses and governments, and earnestly implementing the resolutions adopted at the third session of the sixth provincial people's congress.

1. Efforts have been made to actively formulate local regulations and rules.

Since the 3d Plenary Session of the 11th CPC Central Committee, the party and state have stressed that efforts should be made to develop socialist democracy and to improve socialist legal systems. The decision made by the CPC Central Committee with regard to the drive to conduct reforms in economic systems has pointed out that "the drive to conduct reforms in economic systems and the development of the national economy have enabled more and more economic relations and the guiding principles of economic activities to be fixed in a legislative way and that the state legislative organs should accelerate their pace in economic legislation." The decision made by the CPC Central Committee with regard to conducting reforms in educational systems has also pointed out that the people's congresses at all levels should formulate their own provisions on enforcing compulsory education. In line with the demands mentioned above, the standing committee has actively conducted local legislative work in order to ensure the implementation of the Constitution and the state law in the province and to meet the need of the province's actual situation prevailing in conducting reforms in economic, scientific and technical, and educational systems.

Over the past year, the standing committee has formulated, in succession, the following six local regulations and rules: The trial provisions on provincial financial supervision, the Shijiazhuang City provisions on managing city appearance and public health, the provincial temporary provisions on urban public health management, the provincial provisions on managing water sources, the provincial temporary provisions on developing vocational and technical education, and the provincial provisions on managing the people's campaign obligatory for planting of trees. In addition, the standing committee has preliminarily examined the draft provincial temporary provisions on confiscating or dealing with stolen money and goods, the draft provincial trial provisions on highway management, and the draft provincial temporary provisions on conducting financial management at the township-town level. It has also discussed and made a decision to submit the draft provincial provisions on making compulsory education universal to the fourth session of the sixth provincial people's congress for examination and approval. Of the 10 local regulations and rules mentioned above, 6 concern economic aspects, 3 educational and public health aspects, and 1 political aspects.

In formulating local regulations and rules, our major methods are as follows: 1) Efforts have been made to formulate legislative plans in a planned manner and by aiming at major aspects. 2) Efforts have been made to uphold the principle of adopting an active and careful attitude toward the work. 3) Efforts have been made to carry out investigation and studies in a penetrating way, to further keep abreast of the whole situation, and to provide an objective basis for legislation. 4) Efforts have been made to fully carry forward democracy.

Over the past year, we have organized the departments convened in a timely manner to discuss the 16 draft laws issued by the NPC Standing Committee for soliciting local opinions with regard to the provisions on resident identification cards, the civil code, the law on compulsory education, the law on joint-venture enterprises with foreign firms, the fishery law, the pastoral law, and the regulations and rules on departures and arrivals of foreigners and departures and returns of citizens. We have also collected all revised opinions offered by the deputies and reported them to the NPC Standing Committee.

2. Efforts have been made to earnestly hear and discuss the work reports given by the provincial people's government, the provincial higher people's court, and the provincial people's procuratorate and to enhance the supervisory work.

In line with the supervisory function and power given by law to the people's congress standing committee and the demands set forth in the speech by Peng Zhen, chairman of the NPC Standing Committee, with regard to supervisory work, we have actively carried out legal and work supervision and convened standing committee meetings to hear and discuss the work reports given by the government, the people's court, and the people's procuratorate. This represents a basic supervisory style and also represents support and encouragement to the work undertaken by the government, the people's court, and the people's procuratorate. In hearing and discussing the work reports, attention has been paid to the following four aspects of the reports:

1. Efforts have been made to hear and discuss the reports on the implementation of the law and the local regulations and rules.

2. Efforts have been made to hear and discuss the reports on the implementation of the resolutions adopted by the provincial people's congress or by its standing committee.

3. Efforts have been made to hear and discuss the reports on the drive to conduct reforms.

4. Efforts have been made to hear and discuss the reports given by the provincial nationalities affairs committee with regard to the work situation.

In its daily work, the standing committee has paid attention to and enhanced the supervision over the implementation of the Constitution and the law in line with the demand of grasping construction on the one hand and legal systems on the other and has consulted with the departments concerned on the work of correcting some practices against the provisions of the law.

3. Efforts have been made to carry out penetrating investigation and studies.

Carrying out investigation and studies not only constitutes the basic method of the work undertaken by the people's congress standing committee, but has also become its daily working task. The work of carrying out investigation and studies has been conducted chiefly in the following three aspects: 1) Investigation and tudies have been carried out in formulating local regulations and rules. 2) Investigation and studies have been carried out in line with the topics for discussion and important issues raised at the regular meetings of the standing committee. 3) Investigation has been carried out to learn about the situation prevailing in the implementation of the Constitution, the law, the local regulations and rules, and the resolutions adopted by the standing committee.

4. Efforts have been made to strengthen ties with deputies.

Establishing ties with deputies constitutes one of the daily works undertaken by the provincial people's congress standing committee. Tasks that have been fulfilled in this regard are as follows:

1. Efforts have been made to earnestly implement the measure of the provincial people's congress standing committee with regard to establishing ties with deputies, to contact the people's congress standing committees at city and county levels in order to learn about the implementation of the measures, and to sum up and push forward the work of making contact with deputies.

2. Efforts have been made to earnestly deal with the motions, proposals, criticisms, and opinions raised by the deputies at the third session of the sixth provincial people's congress.

3. Efforts have been made to handle petitions made by the people and deputies in letters or through visits. Over the past year, the standing committee has received more than 1,800 petition letters sent by the people and deputies and handled more than 460 petitions made by them through visits.

4. Efforts have been made to organize deputies and standing committee members to carry out inspections. Since the third session of the sixth provincial people's congress, we have organized the staff members of the standing committee and deputies to carry out three inspection activities.

5. Efforts have been made to make close contact with the people's congress standing committees at city and county levels.

In making contact with the people's congress standing committees at city and county levels, the standing committee of the provincial people's congress has fulfilled chiefly the following tasks: 1) Efforts have been made to hold work forums of the people's congress standing committees at city, county, and (city-level) district levels. 2) Efforts have been made to train cadres for the work. 3) Efforts have been made to enhance the compilation of the "Bulletin" published by the provincial people's congress standing committee and the "Working News" published by the general office under the standing committee.

6. Efforts have been made to strengthen the self-improvement of the standing committee.

The new situation in which socialist material and spiritual civilizations are built simultaneously, the building of democracy and legal systems is further enhanced, and the programs of conducting reforms and enforcing the policy of opening to the outside in order to enliven the domestic economy are carried out, has set forth higher demands for the work of the people's congress standing committees. In order to enable the standing committee to better meet the demands set forth by the new situation for organizations, ideology, work style, and working methods, and to enable it to truly become the local authoritative organ of state power and to fulfill various tasks given by the law, we have continuously strengthened the standing committee's work of self-improvement over the past year, attached importance to studying the state principles and policies and legal knowledge, done our work in strict accordance with the law, and fully carried forward democracy.

Generally, speaking, over the past year, since the third session of the sixth provincial people's congress, the standing committee has scored certain achievements in its work. However, there has been a gap between its achievements and the function and power given by the law as well as the demands set forth by the new situation for the standing committee work. The standing committee has not done enough in conducting legal supervision and should try further to sum up its experiences gained in this regard. Under the circumstances in which legislative tasks have become heavier and heavier, our legislative work still cannot completely meet the need of the drive to conduct reforms. The work of having the standing committee conduct self-improvement and of making contact with deputies should also be further enhanced. The quality of the standing committee regular meetings should be further upgraded. We have not done enough in the work of foreign affairs, which still cannot meet the need of enforcing the policy of opening to the outside.

In 1986 we should continuously regard the spirit of the National Conference of Party Delegates as guiding ideology; earnestly follow up on the report given by Premier Zhao Ziyang with regard to the Seventh 5-Year Plan and the principles, tasks, and demands set forth by the Seventh 5-Year Plan; and emphatically do a good job in grasping the following work under the leadership of the provincial CPC committee: 1) Efforts should be made to further enhance the legal supervision; to conduct inspection and supervision in a planned and organized manner over the implementation of the Constitution, the law, the local regulations and rules, and the resolutions adopted by the provincial people's congress and its standing committee; to emphatically deal with the problem whereby people do not abide by the law in doing things and personnel do not strictly enforce the law; and to consult the departments concerned in a timely manner in order to deal with the exposed violation cases. Efforts should be made to continuously enhance legislative work and to actively and carefully formulate local regulations and rules in line with the practical need of the drive to conduct reforms and to enforce the open policy. In 1986 the standing committee plans to formulate 8 or 10 local regulations and rules. 2) Efforts should be made to do a good job in convening regular meetings of the standing committee. 3) Efforts should be made to organize standing committee members to carry out inspection activities in line with the new situation and problems cropping up in the drive to conduct reforms and in line with the issues which the masses are most concerned about. 4) Continuous efforts should be made to enhance the building of organs.

Fellow deputies, the year 1986 is the first year in implementing the Seventh 5-Year Plan in an overall way. In line with the general demand of building socialism reflecting Chinese characteristics and the basic principle of enforcing the policy of opening the outside in order to enliven the domestic economy, the standing committee of the provincial people's congress will continuously and earnestly exercise its function and power given by the Constitution and the law this year, earnestly implement the state principles and policies, and, by displaying the spirit of vigorously making progress, unite as one in struggles, and conduct work in a down-to-earth manner in order to make new contributions to promoting the building of material and spiritual civilizations in the province and fulfilling the Seventh 5-Year Plan.

The work report delivered above is now presented for consideration.

BEIJING MUNICIPAL PEOPLE'S CONGRESS SESSION OPENS

SK270350 Beijing BEIJING RIBAO in Chinese 14 May 86 p 1

[Excerpts] The Fifth Session of the Eighth Beijing Municipal People's Congress ceremoniously opened on the morning of 13 May at the Great Hall of the People.

At the opening ceremony, Chen Xitong, mayor of Beijing Municipality, made the "Report on the Seventh 5-Year Plan for Economic and Social Development" to more than 800 people's deputies from all fronts in the municipality, and submitted the "(Draft) Seventh 5-Year Plan for the Beijing Municipal Economic and Social Development" to the present session for examination. He said: "During the Sixth 5-Year Plan period, the reform has gradually developed from the rural areas to the urban areas in line with the generla principle of opening up to the outside world and invigorating the domestic economy, thus always being the motive force of the development of our various undertakings. The reform has instilled vitality into the economic undertakings, has directed the economic undertakings onto the orbit of focusing on the improvement of economic efficiency, and has promoted the rapid development of production and ths progress of the scientific, technological, cultural, educational, and other undertakings. He pointed out: Carrying out the economic structural reform and the reform in other fields continuously and penetratingly constitutes the central task of the Seventh 5-Year Plan period, as well as the key to realizing the Seventh 5-Year Plan. The people throughout the municipality should adhere to the correct orientation of the reform.

The executive members of the presidium served as the executive chairmen of the meeting held on 13 May. They were Li Ximing, Zhao Pengfei, Jiao Ruoyu, Wang Jialiu, Li Qiyan, Li Guang, Wang Lixing, Wang Xian, Pan Yan, Fan Jin, Ma Yaoji, Hou Jingru, Wen Jiasi, Pu Jiexiu, She Diman, Cheng Mingshao, Wang Dazhong, Xing Jun, Rong Yi, and Xia Qinlin.

At 0900 on 13 May, Zhao Pengfei, executive chairman of the meeting, declared the session open. People's deputies to the session and other personnel stood to sing the national anthem. Then, Mayor Chen Xitong delivered a report to the session. His report consists of four parts: 1) The fulfillment of the Sixth 5-Year Plan; 2) the basic tasks of the Seventh 5-Year Plan; 3) Carrying out the reform in a positive, stable, and penetrating manner; and 4) vigorously promoting the building of socialist spiritual civilization, the democracy, and the legal system.

Members participating in the Fourth Session of the Sixth Beijing Municipal CPPCC Committee attended the 13-May meeting as observers.

Also attending the meeting as observers were other leading comrades of the municipal people's government; responsible persons of the municipal higher people's court and the municipal people's procuratorate; responsible persons of the municipal CPC committee, the municipal people's congress standing committee, and various departments, commissions, offices, bureaus, and companies under the municipal people's government; and responsible persons of various district and county people's congress standing committee and people's governments. Also attending were part of the municipal people's deputies to the Sixth NPC. They include Dong Jianhua and Zhang Binggui, members of the NPC Standing Committee.

On the afternoon of 13 May, people's deputies discussed Chen Xitong's report in groups. On the morning of 14 May, the session held its second plenary meeting.

PROVINCIAL AFFAIRS

HEILONGJIANG PEOPLE'S CONGRESS SESSION CONCLUDES

SK302254 Harbin Heilongjiang Provincial Service in Mandarin 0900 GMT 29 May 86

[Text] After a 10-day meeting, the fourth session of the Sixth Heilongjiang Provincial People's Congress successfully concluded in the provincial exhibition hall on the afternoon of 29 May.

The session urged the people of various nationalities throughout the province to further closely unite as one, to carry forward the spirit of arduously doing pioneering work and of the Old Foolish Man removing the mountain, to strive to fulfill the Seventh 5-Year Plan in an all-round way, to make the economy prosperous in 1990's, and to build socialism with Chinese characteristics.

Presiding over today's session were executive members of the session's presidium, including Li Jianbai, Chen Yuanzhi, Lu Guang, Wei Zhimin, Wang Jinling, Liu Huixian, Wang Pili, Wang Zhaozhi, Wang Jun, Zhao Zhenhua, and Zhang Ruoxian.

Today's session, presided by Li Jianbai, opened at 1400. He announced that attending the session were 820 deputies, who constituted a quorum.

The session first approved the resolutions of the Seventh 5-Year Plan for economic and social development and of the report of the Seventh 5-Year Plan, and adopted a resolution on approving the report given by Governor Hou Jie on behalf of the provincial people's government, entitled "Uphold the Principle of Conducting Reforms, Conduct Work in a Down-to-Earth Manner, and Strive To Fulfill the Seventh 5-Year Plan in the Province." The session approved in principle the Seventh 5-Year Plan formulated by the provincial people's government for economic and social development.

The resolution adopted at the session stated that our province scored new achievements during the implementation period of the Sixth 5-Year Plan, which have laid a solid foundation for successfully fulfilling the Seventh 5-Year Plan. Such achievements represent the results scored by the people of various nationalities throughout the province, who have made concerted efforts and waged arduous struggles under the leadership of the provincial CPC committee.

The session expressed satisfaction with the work done by the provincial people's government during the implementation period of the Sixth 5-Year Plan and pointed out that the province's situation in politics and the economy during the Sixth 5-Year Plan period was fine. However, there are still weak links in the course of economic and social development and shortcomings and faults in work. In conducting penetrating reforms and making progress, the province still has many difficulties and problems. By no means should we lower our guard in work. The major tasks and basic principles fixed by the province for the Seventh 5-Year Plan are in conformity with the demand for fulfilling the grand target by the end of this century, with the spirit of the national Seventh 5-Year Plan, and with the actual situation in the province. These tasks and principles are completely possible to be fulfilled by the common efforts exerted by the people throughout the province.

The session approved the resolution on the 1986 plan for the national economy and social development and approved the 1986 economic and social development plan submitted by the provincial people's government and the report given by Vice Governor Liu Zhongli with regard to the 1986 economic and social development draft plan. The session also approved the resolution on the province's 1985 final accounts and 1986 budget and approved the 1985 final accounts and the 1986 budget submitted by the provincial people's government and the report given by Zhao Jicheng, director of the provincial finance department, on the 1985 final draft accounts and the 1986 draft budget. The session approved a resolution on implementing the provisions of the PRC compulsory education law and other specific resolutions. The session adopted the work report of the provincial people's congress standing committee, which was delivered by Chen Yuanzhi, vice chairman of the standing committee; the work report of the provincial higher people's court, delivered by Zhang Li, president of the provincial higher people's court; and the work report of the provincial people's procuratorate, delivered by Jia Chengwen, chief procurator of the provincial procuratorate.

The session elected by a show of hands Wang Yuehua, (Xu Shaowan), and (Li Ying) as supplementary members of the standing committee.

The session closed amid the majestic strains of the national anthem after successfully fulfilling various mixed items on the session's agenda.

Seated on the rostrum of today's session were leading comrades from the provincial CPC committee, the provincial advisory commission, the provincial people's government, the provincial CPPCC committee, and the provincial discipline inspection commission, including Sun Weiben, Chen Lei, Hou Jie, Wang Zhao, Li Gensheng, Chen Yunlin, Zhou Wenhua, Wang Yusheng, Li He, Wang Luming, Zhang Lin, Wang Fei, An Zhendong, He Shoulun, Liu Zhongli, and Jing Dowen, Zhang Li, president of the provincial higher people's court; and Jia Chengwen, chief procurator of the provincial people's procuratorate.

Also seated on the rostrum were retired veteran cadres, including Zhao Dezun, Chan Jianfei, Zhang Ruilin, and Wang Minggui.

XINJIANG'S TOMUR DAWAMAT ADDRESS TO PEOPLE'S CONGRESS MEETING

Reports on Seventh 5-Year Plan

HK270207 Urumqi Xinjiang Regional Service in Mandarin 1200 GMT 26 May 86

[Excerpts] The fifth session of the Sixth Xinjiang Regional People's Congress held a grand opening this morning in the People's Hall. Those present as executive chairmen at the opening session included Wang Enmao, Song Hanliang, Amudong Niyazi, Saifulayefu, Li Jiayu, Yang Yiqing, Caodanofu, and Ren Gebai.

Tomur Dawamat, chairman of the regional people's government, delivered a report on the region's seventh 5-year plan. The report was in five parts: 1) the main achievements and basic experiences of the sixth 5-year plan; 2) the guiding ideas and basic tasks for the seventh 5-year plan; 3) resolutely carry out reform of the economic structure in a planned way; 4) vigorously step up the building of spiritual civilization; 5) we must get a good grasp of work in 1986.

He said: In the past 5 years, under the leadership of the CPC Central Committee, State Council, and regional CPC committee, the region has fulfilled or overfulfilled most of the targets and tasks set by the sixth 5-year plan. Great success has been scored in socialist modernization.

He said: In accordance with the demands of the national Seventh 5-Year Plan, and in connection with Xinjiang realities, the basic tasks proposed in the draft of the region's seventh 5-year plan are to continue to consolidate and develop the political situation of stability and unity, ensure the sustained, steady, and coordinated development of the national economy, persevere in reform, invigorate the economy, gradually perfect the market setup, strengthen our ability to control the objective economy [as heard--believe this is misreading for macroeconomy], and basically lay the foundation for a new-style socialist economic setup with Xinjiang characteristics. We should harmonize relationships, readjust structures, set up prospecting of our resources, do a good job in key construction projects, technological transformation, and brain-power exploitation, and ensure that the region's industrial and agricultural output value in 1990 increases by 180 percent [fan yi dian si fan] over 1980 and that its national income per-capita reaches the national average. On the basis of developing production, we should continue to improve urban and rural living standards, and in particular extricate the peasants and herdsmen in poor areas from poverty and enrich them as soon as possible. While stepping up the building of socialist material civilization, we should vigorously strengthen the building of socialist spiritual civilization and bring about a fundamental turn for the better in party style and social mood.

We must waste no time in eliminating the various defects in the present setup that hamper the development of the productive forces, and gradually establish a new economic setup full of vigor and vitality. Thus we should ensure sustained, steady, and coordinated development of the region's economy in the next 5, 10, and 20 years, and even longer.

The session held its second full gathering in the afternoon to listen to reports on the draft of the region's national economy and social development plan for 1986 and on the final accounts for 1985 and the budget for 1986.

(Liu Zonghao), chairman of the regional planning commission, delivered the first of these reports. He reported on the main tasks in the 1986 plan and proposed the main measures fulfilling them.

Mahemaiti Shabier, director of the regional finance department, reported on the final accounts for 1985 and the draft budget for 1986. He said: Generally speaking, the region's financial situation last year was good. Revenue increased by 125 million yuan over 1984, thus achieving for the fourth year in succession the regional CPC committee's demand for revenue to rise by 100 million yuan a year.

He said: To ensure the fulfillment of this year's budget, we must strive to do a good job in the following respects: 1) Open up more sources for increasing revenue on the basis of developing production and improving economic results. 2) Strengthen macroeconomic control, persevere in acting according to our capabilities, and strictly control and economize expenditures. 3) Institute a new financial setup of the prefectures, cities, and counties. 4) Strengthen county-level financial work and promote the accelerated development of economic and cultural construction in the counties. 5) Strengthen fiscal supervision, strictly enforce fiscal discipline, and seriously correct new unhealthy trends.

Economic Achievements, Tasks Reviewed

HK280159 Urumqi Xinjiang Regional Service in Mandarin 1200 GMT 27 May 86

[Excerpts] In his report on the draft of the region's seventh 5-year plan, Regional Government Chairman Tomur Dawamat gave an all-round review of the execution of the sixth 5-year plan.

He said: During the sixth 5-year plan, industrial and agricultural output value rose at an annual average of 11.4 percent, higher than the 6.8 percent average recorded during the years 19852-78. It was also higher than the national average of 11 percent. The region recorded average annual increases of 14.4 percent in light industry and 11.4 percent in heavy industry. Agriculture developed particularly rapidly, recording an average annual rise of 9.6 percent, far exceeding the 6 percent average recorded during the past 36 years. This agricultural performance was provided extremely favorable conditions for all-round and steady economic growth in the region.

Total investment in fixed assets in units owned by the whole people amounted to 13,399 million yuan. New fixed assets amounted to 9,171 million yuan. This has greatly strengthened the region's material and technical foundation for economic and social development.

The region's financial situation took a marked turn for the better during the sixth 5-year plan. The situation of 3 successive years of declining revenue, from 1979 to 1981, was reversed, and a good momentum of steady revival appeared. Since 1982, the region has fulfilled 4 years in succession the regional CPC committee's demand for an annual revenue increase of 100 million. Revenue doubled during the 5 years.

The actual consumption level of urban and rural residents increased by 41.6 percent during the 5 years.

During the sixth 5-year plan, the Xinjiang Production and Construction Corps scored great successes in defending the motherland's border, consolidating stability and unity, and developing economic and social construction. Its industrial and agricultural output value rose at an annual average of 12.7 percent, higher than the regional average. The corps played a backbone and demonstration role.

Tomur Dawamat said: During the seventh 5-year plan, we must maintain a certain growth rate under the premise of improving economic results. Industrial and agricultural output value should rise by an annual average of 8.6 percent. This includes annual rises of 6.4 percent in agriculture and 9.9 percent in industry. National income should rise by an annual average of 8.8 percent. Gross domestic product should rise by an annual average of 9.1 percent.

He said: In deciding on these growth rates, we have made an all-round analysis and forecast of the region's current and future economic and social development and taken into account the changes and demands of various internal factors. We have also taken account of the fact that the region's industrial and agricultural output value growth during the sixth 5-year plan was higher than the stipulated growth rate and that in the past 2 years there has been some swelling in investment and consumption demands. We have in particular taken account of the fact that the all-round unfolding of reform of the economic structure requires a relatively relaxed economic environment. We have therefore appropriately lowered the growth rate for the seventh 5-year plan. This will help in the all-round unfolding of economic structural reforms, in the readjustment of production patterns and product mix, and in further directing our attention to improving product quality and economic results.

Tomur Dawamat pointed out: The growth rate we are setting out now is higher than the national average for the seventh 5-year plan and also higher than the region's average growth rate for the 20 years 1961-80. It is also basically in accord with the average growth required to sextuple [fan liang fan ban] industrial and agricultural output over the period 1981-2000. The growth rate embodies the principle of being positive while also leaving a margin. By attaining this growth rate, by 1990 the region's national income will have grown by 200 percent in 10 years, and there will be a great increase in our economic strength and further improvement in living standards. In this way we can be still more certain of achieving our strategic goal for the end of the century.

Tomur Dawamat reviewed the regional economic pattern for the seventh 5-year plan. He said: During the period of the plan, we should take the existing bases as the props, focus on northern Xinjiang, and also step up the development of southern Xinjiang, so that the northern and southern parts will support and spur each other and get rich together. We must do a good job in improving and expanding the existing industrial bases in the Hami-Urumqi-Karamay area, bring their production potentials into full play, and increase their capacity to support the development of other areas.

He pointed out that proposing such a pattern is determined by the history and current state of economic development in Xinjiang. It is the demand of the objective laws of the development of productive forces. The Hami-Urumqi-Karamay area has good communications, abundant resources, relatively concentrated production, relatively high technological standards and degree of specialization, and relatively strong production capacity and technical installations. To focus on building up this area well is extremely important for the economic development of the entire region.

From the angles of the overall situation and the long-term aspect, to concentrate on developing northern Xinjiang during the seventh 5-year plan is precisely for the purpose of providing better support for southern Xinjiang. Only when the economy of the entire region is developed and our economic strengthe has grown will it be possible to put forward still greater effort in supporting southern Xinjiang and thus speed up its development.

Announces Focal Points in Construction

HK290221 Urumqi Xinjiang Regional Service in Mandarin 0000 GMT 29 May 86

[Text] In his report to the fifth session of the sixth regional people's congress, Regional Chairman Tomur Dawamat said that the focal points for construction in Xinjiang during the seventh 5-year plan are water conservancy, communications, energy, building materials, and education. This has been decided in light of the region's resources conditions, constraining factors, weak links, and feasibilities, and in view of their impact on the region's economic development strategy.

He said: During the period of the plan, we must continue to vigorously step up water conservancy construction, get a good grasp of rounding off projects and reducing seepage, and build a number of new projects needing little investment and producing good results. We should gradually solve problems of spring drought, flood precautions, drainage, and prevention of alkalinization. We must pay special attention to water conservancy construction in pastoral areas, to ensure the development of animal husbandry.

We must assign the development of communications and transport a priority position during the period of the plan. While continuing to get a good grasp of road transport, we must vigorously step up railroad and air transport, improve the transport structure, modernize transport, organize a rational transport pattern, and improve economic results.

We must regard energy and the building materials industry as key sectors during the seventh 5-year plan and give priority to their development, so as to ensure the smooth accomplishment of the plan.

Tomur Dawamat pointed out: Economic development depends on science and technology. Talented people are needed to master advanced science and technology, and such people must be trained through education. We must therefore regard education as a focal point, suitably increase investment in it, strive to improve its quality, provide better teaching conditions, and reform the education structure. We must speed up the training of talented people needed in the four modernizations drive.

SHANDONG'S CPPCC STANDING COMMITTEE WORK REPORT

SK300138 Jinan DAZHONG RIBAO in Chinese 9 May 86 p 2

[Work report of the Standing Committee of the Shandong Provincial Committee delivered by Guo Yicheng, vice chairman of the provincial CPPCC committee, at the fourth session of the fifth provincial CPPCC committee on 8 May: "United the Personages of all Circles To Make Contributions to the Realization of the Seventh 5-Year Plan and the Reunification of the Motherland"]

[Text] Guo Yicheng, vice chairman of the provincial CPPCC committee, delivered a work report of the standing committee of the provincial CPPCC committee at the fourth session of the fifth provincial CPPCC committee on the morning of 8 May.

Guo Yicheng said: Since the third session of the fifth provincial CPPCC committee, new progress has been made in the united front work and the CPPCC work under the new situation, the fields of conducting various forms of political consultation and democratic supervision activities have become wider and wider, and the content of conducting these activities is getting richer and richer. Over the past 1 year, the provincial CPPCC committee has done a lot of work and has created a new situation in facilitating the socialist material and spiritual civilizations and promoting the reunification of the motherland. Guo Yicheng reviewed the work done since the third session of the fifth provincial CPPCC committee.

1. The CPPCC committee brought into full play its functions and advantages of having many talented persons, and suggested means and made efforts for reform and construction.

Over the past 1 year, the CPPCC organizations at all levels concentrated on the central tasks of conducting reform and four modernizations, carried out into full play their role in conducting various forms of political consultation and democratic supervision activities, and successfully put their work on the course of serving the four modernizations. Closely in line with the new situation and the new problems cropping up in the course of opening to the outside world and carrying out reform and construction, the CPPCC committee enthusiastically organized its members to conduct inspection, investigation on special subjects, consultation, and service. Over the past 1 year, the work group for agriculture and forestry, the work group for science and technology, the work group for culture, the work group for sports and the work group for health and medicine under the provincial CPPCC committee visited and inspected more than 30 counties (cities and districts) in succession, including Jiann, Qingdao, Zaozhuang, Yantai, Weifang, Zibo, Jining, Linyi, and Hezei. In accordance with the problems found out through their investigation tours, the CPPCC members wrote reports on special subjects and made constructive suggestions. These reports and suggestions have brought to the attentions of relevant departments and some of them have been adopted.

In the spirit of seeking reality and blazing new trails, the CPPCC members and the personages of all circles initiatively created new work fields in service in the four modernizations. For instance, they helped the government study and formulate the social and economic development plan; offered economic, scientific and technological information; introduced investment from abroad and established lateral ties at home; developed lateral economic cooperation; developed spare-time education; carried out intellectual development; helped the enterprises conduct technological transformation and improve management and operation; and helped the peasants become rich through labor and seek common prosperity.

Last year, together with the provincial democratic national construction association and the provincial federation of industry and commerce, some CPPCC members and the work groups for agriculture and forestry, science and technology, industry and commerce, and sports organized and dispatched by the provincial CPPCC committees separately went to Linyi, Liaocheng, and Linqing to conduct investigation, consultation, and service activities. Better economic results and social effects were scored in these activities thanks to their specific contents.

The CPPCC members also made suggestions for the two civilizations. Since the third session of the fifth provincial CPPCC committee, the CPPCC members have put forward 429 motions, about a 100 percent increase over that of the previous year. These motions have dealt with a wide range of fields in terms of their content and some of them with higher quality have been adopted by relevant departments. This helped solve the problems in the economic, scientific and technological, cultural, educational, public health, and sports fields; and some practical problems concerning the interests of the masses.

2. The spiritual civilization was promoted thanks to carrying out conscientious study and strengthening propaganda.

Over the past 1 year, the CPPCC committee not only organized members to deeply study the basic theory of Marxism and the policies and principles of the party and that state; but also organized various forms of activities such as sponsoring standing committee meetings and report meetings on special subjects to relay and implement the guidelines of the national conference of party delegates and the meeting of cadres of central organs, and attached prominent important to disseminating the experiences of advanced models of CPPCC members and personages of all circles in serving the four modernizations.

Through widely conducting study, propaganda, and education, the CPPCC members and the personages of all circles were further aroused with patriotism and enthusiasm for conducting the four modernizations. Thus, the socialist spiritual civilization has been facilitated.

3. The CPPCC members and personages of all circles were further aroused with enthusiasm thanks to unswervingly grasping the implementation of the policies.

We have scored notable achievements in implementing the policies toward the CPPCC members thanks to the efforts made in the past few years. Over the past 1 year, enthusiastically working in cooperation with the departments concerned under the leadership of the provincial CPC committee, we have made new progress in implementing the policies toward the CPPCC members. The problems existing in the provincial CPPCC committee have been solved one after another. So far, the problems concerning the CPPCC members of our province left over by the previous policies have been solved. With regard to the implementation of the policies toward the provincial CPPCC members, we focused on grasping the work of returning to the owners the private houses and the property illegally occupied and confiscated during the "Great Cultural Revolution" period. With the concerted efforts of the departments concerned, the provincial CPPCC committee also solved a number of problems with greater difficulties. So far, 94 percent of the problem concerning the CPPCC members at the city and county levels have been solved. Through grasping the work of implementing the policies, the CPPCC members and personages of all circles were further aroused with enthusiasm for loving the country and serving the four modernizations.

4. We enthusiastically carried out the work toward compatriots in Taiwan and Hong Kong and Overseas Chinese and made new contributions to the great cause of reunifying the motherland.

The reunification of the motherland has been a great cause of the Chinese nation for a thousand years as well as a new task of the united front work departments under the new situation. The provincial CPPCC committee concentrated on the following few tasks for reunifying the motherland. First, we readjusted and strengthened the liaison organs in charge of the reunification of the motherland. Second, some provincial CPPCC members and personages of relevant departments in Jinan were invited to participate in a tea party on the Mid-Autumn Festival of last year to talk about the current situation and the issue concerning the reunification of the motherland and to express their profound thought of their relatives in Taiwan. Thus, they enhanced their enthusiasm for doing their part for the realization of the peaceful reunification of the motherland. Third, in cooperation with relevant departments, the provincial CPPCC committee enthusiastically carried out the work toward the compatriots in Taiwan and Hong Kong and Overseas Chinese and their relatives in the mainland; and extensively disseminated the CPC Central Committee's scientific idea of "one country, two systems" and a series of policies and principles on the exchange of mail, trade, and air and shipping services between the mainland and Taiwan to realize the reunification of the motherland. Thus, the compatriots in Taiwan and Hong Kong and Overseas Chinese further enhanced their enthusiasm for loving the country and serving the four modernizations.

5. We further strengthened the construction of the CPPCC organizations and the contacts with the city and county CPPCC organizations.

In the past 1 year, the organs under the provincial CPPCC committee further enhanced the ideological and political work, attached importance to the consolidation of the organizational and professional work, readjusted the organizational structure, and replenished their personnel. Through grasping education for in-service cadres and the construction of television colleges, the political understanding and the professional ability of the office workers have been upgraded.

In order to further facilitate the development of grassroots CPPCC work, the provincial CPPCC committee strengthened the contacts with the city and county CPPCC organizations. Responsible comrades of the provincial CPPCC committee extensively conducted investigation and studies on the issue concerning better serving the two civilizations among more than 30 county (city and district) CPPCC organizations of 12 prefectures and cities, including Qingdao, Yantai, Weifang, Jining, Zaozhuang, Taian, Zibo, Liaocheng, Dezhou, Huimin, Dongying, and Linyi. In the course of investigation and studies, these responsible comrades worked in cooperation with relevant departments to study ways for solving the practical problems existing in these areas such as the organizational establishment, personnel installment and wages and treatment. Some of these problems have been solved while others are being solved. Simultaneously, in line with the work demands, we also sponsored study work conferences, motions work conferences, and work conferences on the historical accounts of past events to understand the current situation, to exchange experiences, and to build closer relations between various CPPCC organizations. This had offered favorable conditions for carrying out the grassroots CPPCC work.

Guo Yicheng said: We have done a lot of work and have scored better achievements in our work since the third session of the fifth provincial CPPCC committee. These achievements resulted from our conscientious implementation of the party's policies and principles under the correct leadership of the provincial CPC committee as well as the concerted efforts of all CPPCC members, personages of all circles, and office workers. However, our united front work and CPPCC work still failed to meet the demands set forth by the party in the new situation. Our way of thinking did not suit the demands of the development of the situation and our workstyle was not thorough enough. We failed to conduct sufficient investigation and studies on the new conditions and new problems cropping up under the new situation. From now on, we must carry forward our achievements, eliminate our shortcomings, and work industriously and in the spirit of doing pioneering work in order to make great contributions to making the motherland flourish and realizing the reunification of the motherland. From now on, we must grasp the following few tasks.

1. We should further implement the guidelines of the National Conference of Party Delegates and the seventh plenary session of the fourth provincial CPC committee, and continue to achieve political consultation and democratic supervision with a focus on developing the socialist material and spiritual civilizations. The Seventh 5-Year Plan on our country's national economic and social development adopted at the Fourth Session of the Sixth NPC has

provided the CPPCC work with new content and wider prospects. In line with the regulations set forth in the Constitution of the CPPCC, we should hold as scheduled the plenary sessions, the standing committee meetings, and meetings of chairmen and vice chairmen; and help the provincial CPC committee hold the bimonthly forums of nonparty personages to extensively discuss the major issues as the strategic study of the province's economic development, the formulation and implementation of the Seventh 5-Year Plan, and reform. The CPPCC members should initiatively put forward suggestions and opinions in order to better serve the work of carrying out reform and opening to the outside world and to make the economy flourish. The provincial CPPCC committee should also give assistance to and work together with the provincial CPC committee and government to thoroughly carry out the education on ideals, morality, discipline, and legality, and to strengthen the construction of legal system in order to realize a fundamental turn for the better in party style and social conduct as soon as possible and to better handle Shandong's affairs.

2. We should bring into full play the CPPCC's role as an overall bank of talented persons, and successfully carry out various forms of service activities. In line with the demands for the CPPCC set forth by the party and the state in the new situation and closely focusing on the four modernizations, we should conscientiously organize the CPPCC members to conduct inspection and studies, investigation on special subjects, and service activities. The CPPCC organizations at all levels; in particular, the CPPCC organizations in the coastal open cities, should have their feet firmly planted at home and keep in view the compatriots in Taiwan and Hong Kong and Overseas Chinese to continue to pioneer new work fields. In line with the demands of reunifying the motherland the rejuvenating China, and proceeding from expanding the relations between the people inside and outside the country, we should extensively launch friendly activities. The provincial CPPCC committee should enthusiastically help the provincial CPC committee and government achieve the work of bringing in capital, technology, equipment, and talented persons from abroad; engage in the work of mediating the contradictions cropping up at the talks on bringing in foreign items; open up and develop channels for creating foreign exchange through export; reflect the suggestions and demands set forth by the personages living abroad; and understand the situation of the management and development of the Chinese-foreign joint ventures and cooperative enterprises. Simultaneously, the provincial CPPCC committee should train talented persons in service of reform and opening to the outside world, and make suggestions and offer information in these regards.

3. We should conscientiously organize CPPCC members to engage in study and vigorously strengthen the propaganda and education on the united front work and the CPPCC work. We should fully understand the importance and necessity of the strengthening of study in the new situation so that the CPPCC members will be able to make efforts to study Marxism and Leninism, current policies, and scientific and educational knowledge. So far, we should organize CPPCC members to study the documents of the Fourth Session of the Sixth NPC and the Fourth Session of the Sixth National CPPCC Committee in order to ceaselessly upgrade their ideological awareness and understanding of the policies. We should deeply strengthen the propaganda and education on the principles

and policies on the united front work, and make the most of such propaganda means as the press and radio and television broadcasting to vigorously disseminate the typical advanced experiences of the CPPCC members on all fronts and the personages of all circles. Through disseminating the theory of the united front work and bringing into play the role of the CPPCC members, the vast number of cadres, in particular, leading cadres at all levels will be able to upgrade their understanding of the essence, position, and functions of the united front work and the CPPCC work in the new situation.

4. We should further implement the policies toward the CPPCC members. Although we have made great achievements in this regard, there are still many problems. In particular, the problems left over by the previous policies were very complicated and the tasks for solving these problems are quite arduous. Thus, we must conscientiously sum up experiences and adopt effective steps and measures for solving these problems in a down-to-earth manner under the leadership of the provincial CPC committee and with the assistance of relevant departments in an effort to accomplish this work within this year.

5. We should continue to carry out the work of promoting the reunification of the motherland. We should extensively disseminate the central authorities' scientific idea of "one country, two systems" and a series of principles and policies; and initiatively introduce the new achievements in the construction of the motherland. We should strengthen the work of writing the propaganda manuscripts so as to further improve the quality of propaganda work and increase the quantity of the manuscripts. We should adopt various forms to strengthen our contacts with the compatriots in Taiwan and Hong Kong and Overseas Chinese, enthusiastically do a good job in receiving them, and grasp the work toward their relatives and friends living on the mainland. Through expanding the exchanges of trade, mail, and air and shipping services between the mainland and Taiwan, and widely making friends with the compatriots in Taiwan and Hong Kong and Overseas Chinese, we will be able to improve the mutual understanding and the friendship between the people in the mainland and Taiwan, and to enhance the people's enthusiasm for loving the country. We should enhance the relations and cooperation with all democratic parties, nonparty personages, the federations of industry and commerce, federations of Taiwan compatriots, and the city and county CPPCC organizations; and give publicity to the outside places in order to wind up the situation of separating Taiwan from the mainland and to realize the great cause of reunifying the motherland as soon as possible.

6. We should further achieve the work of handling motions and handling visitors and incoming letters from the masses. This year, we should strive to upgrade the quality of handling motions focusing on the central work of the country and the province; in particular, the Seventh 5-Year Plan, the system reform, and the realization of a fundamental turn for the better in party style and social conduct. The motions work committee should consciously study and handle the motions put forth by the members and sponsor forums, reception meetings, and coordination meetings on promoting the implementation of the motions so as to ensure that the motions will be handled one after another.

7. We should strengthen the self-construction of the organs under the provincial CPPCC committee and give guidance to the work of the city and county CPPC organizations.

Guo Yicheng concluded: On the basis of comprehensively fulfilling or overfulfilling the Sixth 5-Year Plan, our country has started the implementation of the Seventh 5-Year Plan. In the new year, we should conscientiously implement, under the correct leadership of the provincial CPC committee, the series of principles and policies of the CPC Central Committee, and make efforts to achieve the work in all fields in the spirit of working persistently and dauntlessly and advancing despite difficulties in order to make new contributions to the realization of the Seventh 5-Year Plan, the reform of the economic structure, and the realization of a fundamental turn for the better in party style and social conduct.

TIANJIN CPPCC STANDING COMMITTEE ISSUES WORK REPORT

SK010452 Tianjin TIANJIN RIBAO in Chinese 12 May 86 p 3

[Report by Zhao Jinsheng on the work of the Seventh Tianjin Municipal CPPCC Standing Committee, presented at the fifth session of the seventh municipal CPPCC committee on 19 April]

[Excerpts] Fellow members:

It has been 1 year since the third session of the seventh municipal CPPCC committee, which was held in April 1985, and which was followed by the fourth session in October 1985. Entrusted by the municipal CPPCC standing committee, I would like to deliver a report for consideration with regard to the work done in the past year.

In 1985 our country took a bold step in the drive to conduct reforms in economic systems with the work emphasis on urban reforms and won a new victory along the road of building socialism reflecting Chinese characteristics. Our municipality also created an excellent situation in transformation and scored heartening achievements in it. Under the leadership of the municipal CPC committee, our municipality also achieved new development in the work of the CPPCC committee.

During the past year, the municipal CPPCC committee has conducted new exploration in pushing forward the drive to build socialist material and spiritual civilizations and promoting the peaceful reunification of the motherland by bringing into play the strong point of the CPPCC committee, the comprehensive tank, and has achieved new development in this regard. Major tasks fulfilled by us are as follows:

1. Efforts have been made to achieve new development in the work of carrying out political consultation and democratic supervision.

After the beginning of the drive to conduct reforms in economic systems with the work emphasis on urban reforms, the party and the government attach all the more importance to bringing into play the basic CPPCC role in conducting "political consultation and democratic supervision." Responsible comrades from the municipal CPC committee attended, on many occasions, the meetings and activities sponsored by the municipal CPPCC committee.

After the convocation of the 4th Plenary Session of the 12th CPC Central Committee, the National Conference of Party Delegates, and the 5th Plenary Session of the 21th CPC Central Committee in September 1985, the municipal CPPCC committee held an enlarged standing committee session to concentrate on studying the important documents adopted at these sessions and conference and the report given by Li Peng, Political Bureau member of the CPC Central Committee, member of the CPC Central Committee Secretariat, and vice premier, at the 10th National CPPCC Standing Committee meeting with regard to the proposals for formulating the Seventh 5-Year Plan and the issue on further readjusting the staff of the central leading organs by the CPC Central Committee. The enlarged session also adopted a resolution on studying and implementing the spirit of the National Conference of Party Delegates.

Before the enlarged session, we organized more than 470 municipal CPPCC members and national CPPCC members who were in Tianjin into five groups to make an observation tour among the 10 areas and units, including the economic development zone, the Tianjin constrainer wharf, and the international market. They also held on-the-spot forums with the units.

After issuing the plan for conducting reforms in commodity prices, the municipal pricing bureau issued certificates of price inspection to 137 municipal CPPCC members in line with the proposal raised by the CPPCC members' motions. Many members displayed their high sense of responsibility by carrying out price inspection with their certificates among their neighboring markets.

Since the third session of the seventh municipal CPPCC committee, the municipal committee has received 749 motions submitted by the members. As of 2 April, all motions were dealt with and answers were given to the members. In order to encourage members to submit their motions, the municipal committee established a permanent organ in the motions examination committee and worked out systems for the work.

In 1985 the municipal CPPCC committee continuously grasped the work of implementing the policies and helping the party and government deal with the leftover problems, and solved the "long-standing" problems, such as dealing with housing problems for several members, paying them retroactively, and compensating for property damage caused them as a result of the "Cultural Revolution."

2. Efforts have been made to open new spheres in rendering services to economic construction and the drive to conduct reforms.

The decision adopted at the 3d Plenary Session of the 12th CPC Central Committee with regard to conducting reforms in economic systems has set forth the outline and blueprint of building socialism reflecting Chinese characteristics. Successfully conducting reforms in economic systems to make progress in building the four modernizations represents a road of making China prosperous and ahope harbored by the country and the Chinese nationality as a whole.

Bringing into play the strong point of the CPPCC committee, the comprehensive think tank, in order to render services to economic construction and the drive to conduct reforms in varius fields represents a glorious task and a new subject faced by the CPPCC committee in the new historic period. During the past year, the municipal committee has actively conducted exploration and practice in this regard.

In bringing into play the overall function and role of the CPPCC committee, the comprehensive think tank, the municipal committee concentrated on helping a county do a good job in building the two civilizations and studied and summed up the experience gained in this regard in order to expand the service scope. This has been a task fixed by the municipal CPPCC committee after conducting repeated deliberations, consultations, and profound discussions during the past year.

Along with the penetrating drive to conduct reforms in urban ecomomic systems and to enforce the policy of opening to the outside, a new task faced by us with regard to having the united front work department and the CPPCC committee render service to the building of townships and towns has come up.

The municipal CPPCC committee has organized its members to carry out investigation on special problems, to hold discussions on special topics, and to render advisory service in line with the problems cropping up in the programs of construction and transformation, problems that should be dealt with urgently. This has become a basic style of our service in economic construction. During the past year, 14 work teams organized by the municipal CPPCC committee have carried out investigation and studies on speical problems cropping up in 5 fields and held 12 forums on special topics, such as the issue of developing township and town-run enterprises, the issue of upgrading the quality of printing and dyeing cotton textile products, the issue of conducting reforms in educational and scientific and technical systems, and the issue of dealing with the problems of concern to the masses.

Tianjin is an open city. Making use of the favorable conditions created by the CPPCC members through extensive social contacts and overseas relationships in order to serve the municipal programs of enforcing the open policy and conducting technical imports has constituted an important task of the CPPCC committee in service of economic construction. Through the work conducted by the members in liaison and making of recommendations during the past year, the municipal departments concenred have held talks with businessmen from foreign countries and Hong Kong with regard to 39 joint-venture business and technical cooperation projects. Of these talks, a deal on one item has been concluded, agreements with regard to six items have been signed, and other items are still being discussed.

3. Efforts have been made to conduct new exploration in promoting the progress in building spiritual civilization.

While opening new spheres in serving the programs of economic construction and conducting reforms in various fields during the past year, the municipal

CPPCC committee has also tried to work out a new road of making progress in building socialist spiritual civilization. In cultural and education aspects, the education group under the municipal CPPCC committee has carried out lecture activities and the literary and art group has held discussions on special topics. Both of them have put forward positive suggestions to the departments concerned. In conducting ideological construction, efforts have been made to chiefly conduct study on the policies and current situation and to publicize the advanced deeds and ideology displayed by the members.

At the end of 1985, the municipal CPPCC committee held an experience-exchange meeting and concentrated on publicizing the advanced ideology and touching deeds scored by more than 20 of the National CPPCC Committee members in Tianjin, the municipal CPPCC members, and the district and county CPPCC members with regard to making marked contributions to fostering the practice of having ideals and abiding by discipline, which found a warm echo in the hearts of personages of various social circles.

The work concerning literature and history and translation and editing constitutes an important task of the CPPCC committee in serving the program of building the two civilizations. During the past year, the municipal CPPCC committee has achieved new development in the work on historical accounts and past events. In addition to collecting historical materials, editing and publishing the "selected works" of municipal historical accounts and past events, the reorganizing and publishing the historical materials on special topics, the municipal CPPCC committee has also opened a service center for literary and historical books and periodicals and new publishing channels in order to better serve the personages of various social circles and to make things convenient for readers.

4. Efforts have been made to make progress in the cause of peaceful reunification of the motherland.

A series of correct principles issued by the CPC Central Committee with regard to dealing with the Taiwan issue, particularly the ideal of "one country with two systems," and the smooth settlement of the Hong Kong issue have exerted tremendous influence on Taiwan and the Overseas Chinese. Thus, the United Front Work Department has created an unprecendented excellent situation in work. To meet the need of the new situation and to make progress in the cause of peaceful reunification of the motherland, the motherland reunification fellowship committee under the municipal CPPCC committee has fulfilled the following four tasks: 1) Efforts have been made to enhance friendly contacts with Taiwanese compatriots, family members of personnel in Taiwan, and personages concerned; to invite them to attend the study and report meetings and the activities sponsored by the municipal CPPCC committee; and to organize them to view the new achievements scored in construction by the municipal administrative authorities. 2) Efforts have been made to enthusiastically receive letters and visits intended for the purpose of presenting petitions, to help such personnel deal with problems cropping up in their livelihood and in the implementation of policies, and to assist them to find their overseas relatives and to establish contact, through messages, with their overseas relatives. 3) Efforts have been made to present showings of Taiwanese documentary films, and to hold small-scale forums and report meetings on the Taiwanese situation in order to help them learn about the history of Taiwan and its current situation. 4) Efforts have been made to basically carry out the united front work abroad.

5. Efforts have been made to enhance guidance and contact with the CPPCC committees at the district-county level.

Developing the work of the united front and the CPPCC committee in rural areas represents the new characteristics in this regard in the new historic period. To follow the provisions of the CPPCC regulations and rules and to meet the need of developing the CPPCC work, the municipal CPPCC committee has further strengthened contacts with the CPPCC committees at the district-county level during the past year.

Fellow members, the year 1986 is the first year in which our country will begin to fulfill the Seventh 5-Year Plan; to implement the principle of "consolidation, digestion, supplementation, and improvement"; and to push forward in a down-to-earth manner the drive to conduct reforms in economic systems. In 1986 our mission is to continuously serve the three major tasks with the central work of building socialist modernization. Our work emphasis will be placed on helping the party and government do a good job in conducting reforms in economic systems and building socialist spiritual civilization while successfully conducting economic construction. In our work, we will vigorously encourage staff members to display the spirit of boldly pioneering roads and creating something new, stressing practical effects, and enthusiastically serving the members and personages of various social circles in order to scale new heights in CPPCC work under the new circumstances.

Our major tasks in 1986 are as follows:

1. Efforts should be made to closely coordinate the party's central task and to enrich the content of political consultation and democratic supervision in order to upgrade the quality of consultation and discussion.

2. Efforts should be made to bring into full play the strong point of the CPPCC committee, the think tank, and to vigorously make proposals in line with the programs of reforms and construction in order to be good advisers to and assistants of the party and government organs.

3. Efforts should be made to open new spheres in making progress in building socialist spiritual civilization. We should do much work in pushing forward the work of ideological construction while continuously pushing forward the work of culture and education.

4. Efforts should be made to earnestly organize members and the personages of various circles to attend study activities. Actively carrying out study activities on the current politics, situation, and policies, as well as Marxist theory, will constitute the important content of study activities this year.

5. Efforts should be made to enhance propaganda work and contacts with Taiwan.

6. Continuous efforts should be made to vigorously grasp the work of implementing policies.

7. The organs under the municipal CPPCC committee should improve their work style and upgrade their work efficiency.

Fellow members, under the leadership of the municipal CPC committee, let us display the spirit of the foolish old man removing the mountain, unite as one in struggles, work together with the people throughout the municipality in doing a good job in conducting reforms in economic systems and in building socialist spiritual civilization, and make still greater contributions to fulfilling the Seventh 5-Year Plan and building Tianjin into a new socialist city.

JIANGSU GOVERNOR ADDRESSES MOBILIZATION MEETING

OW250336 Nanjing Jiangsu Provincial Service in Mandarin 1000 GMT 20 May 86

[Excerpts] The provincial government called a mobilization meeting in Nanjing today to speed up the construction of key projects and call on all quarters in Jiangsu to support key state projects more vigorously and to ensure their completion with short construction periods, good quality, low cost, and high efficiency, thereby facilitating economic advances for China and Jiangsu.

During the seventh 5-year plan, Jiangsu faces an arduous task in key construction projects. The budget for 13 projects this year totals 2.5 billion yuan.

Although the construction pace in Jiangsu has been faster than the national average in the first few months of this year, it is necessary to assess the difficulties the province faces in completing the arduous task soberly. For this purpose, Governor Gu Xiulian and Vice Governor Zhang Xuwu set the following four demands on the people of Jiangsu:

First, it is necessary to continue firmly adhering to the principle of controlling the scale to secure key projects, and paying close attention to strictly controlling the scale of investment in fixed assets in economic work.

Second, it is necessary to implement the guidelines for reform, perfect various reform measures, and steadfastly deepen the reform in line with the requirements for consolidation, assimilation, replenishment, and improvement in order to ensure the completion of key state projects with short construction period, good quality, low cost, and high efficiency.

Third, it is necessary to improve the construction market, replenish construction forces, and raise construction management level.

Fourth, it is necessary to further straighten out relationships, clarify responsibilities, improve workstyle, and overcome bureaucracy and unhealthy tendencies in mobilizing all quarters in the province to support key construction projects.

DOJE CERING REPORTS ON XIZANG'S SEVENTH 5-YEAR PLAN

HK240257 Lhasa Xizang Regional Service in Mandarin 1130 GMT 23 May 86

[Excerpts] Regional Acting Government Chairman Doje Cering said in part three of his report on the region's seventh 5-year plan: The task of attaining the seventh 5-year plan is very arduous, and it is essential to adopt correct policies and effective measures:

1. We must continually straighten out the guiding idea on economic work. In order to do this, we must concentrate on solving two problems well: 1) We must continue to clear away leftist influence and seriously organize the cadres, especially those engaged in economic work, to study the central instructions on economic work in Xizang. 2) We must solve the problem of seeking truth from facts and basing all work on Xizang reality. This is of great practical significance for fulfilling the seventh 5-year plan and stimulating economic development and all undertakings in Xizang.

To do this, we must on the one hand seriously sum up the experiences and lessons and be bold to break down old concepts and conventions that do not suit Xizang realities, do not help to mobilize the masses' enthusiasm, and hamper the development of Xizang's productive forces. On the other hand, we must do our work creatively in light of the special conditions of Xizang and the changes continually taking place here.

2. We must carry out deepgoing and systematic reform of the economic structure. During the period of the plan, on the basis of consolidating, digesting, replenishing, and improving the existing fruits of reform in 1986, we must put forward a number of new reform policies and measures in a planned and prepared way. We should strive to lay in 5 years a foundation for a vigorous and lively socialist economic structure suited to Xizang's realities.

Economic structural reform during the seventh 5-year plan can be summaried into the following four main aspects: 1) Get a good grasp of invigorating the enterprises--the cardinal link--and truly turn them into relatively independent economic entities and socialist commodity producers and operators responsible for their own operations, profit, and loss. 2) Further enliven commodity circulation, and establish and develop a commodity market setup. We must regard reform of the circulation field as a major aspect of economic structural reform in the rural and pastoral areas. 3) Strengthen and improve the scope, degree, and measures of macroeconomic control and microeconomic invigoration. These must be compatible with the capacity of macroeconomic control. During the seventh 5-year plan, under the premise of striving to make regulation by market mechanism the dominant factor, we must give full play to the guiding role of the state plans and gradually perfect the various economic and legal measures. We must strengthen control over investment in fixed assets and readjust the investment orientation and structure. We must further reform the prices and taxes setup and the management setup. Through active readjustment of prices, we should gradually improve our ability to control the macroeconomy indirectly. 4) Strengthen lateral economic ties.

3. We must persevere in opening up to the world. We must first step up economic, technical, and cultural exchanges with provinces and regions relatively close to us, and then proceed to strengthen ties and cooperation with other provinces, municipalities, and regions. We must continue to open up to foreign countries. We welcome financiers, businessmen, Tibetan compatriots living abroad, Hong Kong and Macao compatriots, and overseas Chinese living abroad to cooperate with Xizang in economics, technology, and capital and to engage in various developmental activities. We will provide them with the necessary protection, conveniences, and preferential treatment.

4. We must develop more sources of increasing financial revenue. We should do everything possible to tap new sources of revenue, get a good grasp of reducing deficits and increasing surpluses, and improve tax collection work. We must strictly control administrative expenditures and the purchasing power of social groups, strengthen fiscal supervision, and strictly enforce fiscal discipline.

5. We must control the scale of capital construction and improve management. During the seventh 5-year plan, we must regard controlling the scale of capital construction investment, especially investment in non-productive construction, and readjust the investment orientation and structure as an extremely important question and solve it really well. In capital construction management, we must perfect the basic work involved in investment management and strive to save investment, reduce construction cycles, and improve economic results.

6. We must persevere in grasping the two civilizations simultaneously. We must attach great importance to developing the Tibetan cultural heritage and also pay attention to absorbing the outstanding culture of other nationalities. It is essential to strengthen and improve ideological and political work, correct unhealthy tendencies, eliminate rottenness, and crack down hard on serious economic and other crime.

7. We must do a good job in structural reform and improve work style.

PROVINCIAL AFFAIRS

YUNNAN'S HE ZHIQIANG ON EDUCATION, DISASTER MEASURES, CONTROLS

HK020147 Kunming Yunnan Provincial Service in Mandarin 2300 GMT 1 May 86

[Excerpts] He Zhiqiang spoke on this year's science, technology, and education work in his government work report. He said: While continuing to carry out reforms in the science and technology setup, we should prepare for the following tasks: 1) This year we should achieve initial results in scientific research projects concerning breeding aquatic products on the plateau, cultivating tropical fruit, processing animal products, and developing expensive medicinal herbs. 2) We should grasp 23 key projects including the assessment of fine-strain grain seed and the exploitation of natural spice resources. These projects are centered on important issues in the province's economic construction. 3) In popularizing and applying technology, we should encourage able hands and path-breakers from the interior to go to the border areas to disseminate the technology needed there. We should send science and technology personnel to therural areas, border regions, and poor areas to popularize technology. 4) We should organize more science and technology markets in a number of prefectures and counties, so as to stimulate the popularization of the existing fruits of research.

On education work, the report proposed that the province should concentrate on eight tasks this year: 1) Firm up and make good use of education funds. 2) The province and the prefectures and counties should be responsible for training over 20 percent of their primary and secondary schoolteachers. 3) Prepare for the establishment of vocational and technical education centers in various places. 4) Organize courses in mining and metallurgy for Nujiang and Wenshan prefectures. 4) Publicize the law on compulsory education. 6) Tertiary institutes should add such specializations as cured tobacco, tourism, and arts and crafts design and manufacture. 7) Step up and improve ideological and political work in the schools and further correct the ideas on running schools. 8) Organize a provincial education commission to grasp the educational development of the whole of society in a unified way.

Governor He Zhiqiang said in his report: "There have been many natural disasters this year, which have had a serious impact. To make proper arrangements for the livelihood of the urban and rural people is an extremely important task for the government at all levels.

The CPC Central Committee and State Council are extremely concerned for the people in disaster areas of Yunnan. They have sent us relief grain, funds, and materials. The provincial CPC committee and government have taken corresponding measures. In the next stage, we must devote great efforts to grasping agricultural production and stabilizing grain prices. We must also send industrial goods to the rural areas and organize supplies of daily necessities.

We must do a good job in macroeconomic control this year. First, we must control the size of investment in fixed assets. Second, we must effectively control irrational growth of consumption funds. We must further strengthen control over workers' wage funds and administrative spending. It is strictly forbidden to pay out random bonuses, subsidies, and so on.

QINGHAI PROMULGATES REGULATIONS ON GOLD MINING

HK270705 Xining Qinghai Provincial Service in Mandarin 2230 GMT 23 May 86

[Text] On 28 April, the provincial government printed and distributed the province's interim regulations on managing local gold mining and purchase. The regulations urge that based on the principles of opening up, invigoration and improving management, all localities should plan in a centralized way, make overall arrangements for, utilize in a comprehensive way, and rationally develop the province's gold resources.

The interim regulations point out: Gold and other mineral resources are owned by the state. Nobody or no unit is allowed to randomly mine the resources without permission. No collective or individual is allowed to mine in areas which will be developed according to state plans and are under exploration. In case the town and township collective enterprises, as well as individuals, run mines in joint ventures, they must submit themselves for examination to the people's government at and above the county level. Before the provincial people's congress standing congress promulgates the management procedures, they must report to the gold management bureau of the provincial heavy industry department for approval, and should get a permit for mining gold. Then, they should apply for a business license at the industrial and commercial administrative department. Any individual who engages in gold mining should register himself at the county government, which will handle the work in a centralized way, and should apply for a gold mining permit at the county department in charge of gold mining. At the same time, he should sign a gold purchase agreement. Without approval, all localities should not accept the application of those who come from places other than the province to mine gold, run mines or to mine through joint ventures.

The interim regulations stipulates: The province adopts the practice of purchasing the gold in an all-round way. The provincial heavy industry department's gold management bureau will, according to the number of local gold miners, work out an annual mandatory plan for the work, which will be included in the province's national economic plan and will be assigned down to the gold management departments at all levels. From now on, the People's Bank and its branches or other specialized banks entrusted by the People's Bank, are responsible for gold purchases. Any unit or individual who is not entrusted by the bank is prohibited from purchasing gold without permission. Otherwise, he will be assumed to be smuggling and trafficking gold and will be punished for this.

The interim regulations urge all organizations and individuals who engage in gold mining to deliver all their gold and minerals mined to the banks. They are prohibited from privately selling, purchasing, taking for use, exchanging and hiding them. All localities should supply on a priority basis those commodities that are in short supply to peasants who fulfill or overfulfill the annual quota of offering gold for purchase. The provincial government will give awards to those counties that fulfill or overfulfill the annual quota of gold purchase. In addition, the provincial government will, in connection with the amount of gold purchase, allocate to the counties an amount of retained gold for foreign exchange.

ECONOMIC PLANNING

HUNAN PLANNING CHIEF REPORTS ON 1986 ECONOMIC PLANS

HK260225 Changsha Hunan Provincial Service in Mandarin 0900 GMT 25 May 86

[Excerpts] (Wang Xiaofeng), director of the provincial planning commission, said in his report to the provincial people's congress session on the draft national economic and social development plan for 1986 that this year, in the aspect of reforms, the province should concentrate on consolidation, digestion, replenishment, and improvement, in preparation for taking new strides in reform next year and the year after. In economic construction, the province must continue to control investment in fixed assets and excessive growth of consumption funds. The province will also strive to improve supplies, further invigorate the economy, and work for a rough balance between total social supply and demand, to enable the national economy to develop in a steady and coordinated way.

(Wang Xiaofeng) introduced the main economic targets and specific tasks in the 1986 plan. Industrial and agricultural output value should rise by 7.5 percent over 1985 in terms of 1980 prices. Agricultural output value, not including industry at village-level and below, should rise by 5 percent, and industrial output value, including industry at village-level and below, should rise by 9 percent. Gross domestic product should rise by 8.5 percent over 1985. National income should rise by 7.6 percent. Financial revenue should rise by 4.6 percent.

(Wang Xiaofeng) also proposed the main measures for fulfilling the 1986 tasks: 1) Readjust the rural production structure in a planned way, ensure steady increase in grain output, and promote diversification. 2) Improve product quality, reduce input, and ensure an appropriate industrial growth under the premise of improving economic results. 3) Strictly control investment in fixed assets, readjust the investment pattern, and step up construction in energy, communications, raw materials in short supply, agriculture, science, and education. 4) Expand foreign exchange earnings from exports and develop foreign economic relations and trade. 5) Expand commodity circulation and arrange market supplies well to meet the needs of improving people's living standards. 6) Further develop education, science, culture, public health, and physical culture, and vigorously step up the building of socialist spiritual civilization. 7) Step up the work of opening up the mountain areas; and help old revolutionary bases, minority-nationality areas, and remote and poor areas to eradicate poverty and get rich, so as to promote coordinated development of the entire provincial economy. 8) Continue to carry out reforms in the planning setup and strengthen and improve macroeconomic control.

(Wang Xiaofeng) discussed a number of tasks to be tackled this year in reforming the planning setup:

1. Strictly follow the state mandatory plans and gradually improve the management of guidance plans. We should suitably reduce mandatory planning and uphold the principle that whoever issues mandatory plans is responsible for the balancing and coordination of the main production conditions involved.

2. Strengthen control over investment in fixed assets. Thorough assessment must be made of new projects, especially large and medium projects. An evaluation system must be established. Policymaking must be prudent, and strict controls must be exercised. It is particularly important to control the construction of high-standard centers, large buildings, hotels, and office blocks.

3. Continue to strengthen controls over consumption funds and foreign exchange. The control indices governing the number of workers, the total wage bill, and the use of foreign exchange in units owned by the whole people, and those regarding foreign borrowing [words indistinct] arbitrarily exceeded.

4. Improve preparatory work for the plans, along with economic information and forecasting work. In the future the planning commissions must organize the departments and units concerned to repeatedly study, assess, and compare [word indistinct] macroeconomic policy decisions, major productive forces arrangements, and major projects involving investment in fixed assets. Such items can only be included in the plans after the provincial government has decided on them. In the future, without going through these procedures, it is forbidden to put forward temporary motions that would upset the balance of the plans.

5. Actively promote and encourage the development of lateral economic ties.

ECONOMIC PLANNING

GUANGZHOU DEVELOPMENT STRATEGY DISCUSSED

Beijing JINGJIXUE ZHOUBAO [ECONOMICS WEEKLY] in Chinese 5 Jan 86 p 2

[Article by Lin Qixiang [2651 0796 4382]]

[Text] The overall guiding principle for economic and social development in Guangzhou for this century is: With foreign trade as guide, industry and agriculture as support, and light industry, textiles, and tertiary industry as focal core, to construct Guangzhou into a highly civilized, multifunctional, modern socialist central city with strong domestic and international ties. Not long ago at a press conference held in Beijing, responsible comrades from the municipal CPC committee and government answered the following questions:

1. The Question of Direction: Are there differences of opinion regarding the determination of direction? Yes. Some comrades feel that the proportion of the national economy held by foreign trade was not great, only a bit more than 10 percent of the GVIAO. Guangzhou is a center for the accumulation and distribution of national commodities with an estimated 8 billion yuan in total retail commodity sales this year making it second only to Shanghai and Beijing. Therefore, it should be a commercial city and not neglect domestic trade. Does this mean that domestic trade should be central for Guangzhou? Indeed, the current position of domestic trade is vital. Guangzhou products have a good reputation in national markets and sell very well. However, Guangzhou is the great southern gate of the motherland, is adjacent geographically to Hong Kong and Macao, relies on the rich Zhu Jiang delta and has been China's major international commercial port for some time. At present eight southern and southwestern provinces engage in import and export via Guangzhou. The total trade volume of goods via Guangzhou is approximately 10 percent of the national figure. Therefore the city is in an advantageous position regarding the outside. It is a focal point for importation and internal linkup and is in the forefront of China's efforts to get into international markets. From the viewpoint of developmental strategy, Guangzhou should take the lead and focus on foreign trade and business. This is necessary for both China's economic construction and socialist modernization. Of course, this does not imply that domestic trade can be neglected. To the contrary, we must make full use of the role of domestic trade in Guangzhou's economic and social development. Neither aspect should be excessively stressed or ignored. Guangzhou must not only strengthen internal ties, but must emphasize tertiary industry as well and improve the investment environment and pre- during- and post-production services.

2. The Question of Developing Key Focal Points: When proposing taking industry and agriculture as support and light industry, textiles, and tertiary industry as focal, shall we stress tertiary industry? Since the liberation industrial development has been central in Guangzhou, because at the time, it was believed that Guangzhou was a commercial consumer city and was criticized as a semifeudal, semicolonial urban center. Therefore the role of industry was frequently emphasized. Now in light of the demands of strategic development, Guangzhou's economic life should revolve more around foreign trade, whose special needs heavy reliance on industry cannot meet, considering Guangzhou's special characteristics and strategic position. Of course, industry and agriculture have to be relied upon in attempts to focus on foreign trade, but in order to make full use of the city's role as a national, large-scale central city and to enable it to become a strong supply center, Guangzhou's history, current conditions, and resources of capital must all be considered in building it into a major national base for light industry and textiles. We must follow the directions of foreign economic and foreign trade to do a good job of the city's economic construction. We must change the old tendency of emphasizing production while disregard circulation, or emphasizing economic construction while neglect urban construction. Only by focusing on the development of tertiary industry while emphasizing light industry and textiles can we improve Guangzhou's role as a city, provide high-quality diversified services, and create strong domestic and international ties for the city. Of course, the development of tertiary industry will have an obvious effect on local finances, as industry is a major factor in the industrial structure and the largest revenue support for local finances, providing approximately 60 percent. Tertiary industry often involves the social welfare, requires much input and brings in little income. However, the development of tertiary industry is inevitable and remains a key question. Local revenue may be negatively effected for a period of time, but this is just a temporary problem in the course of development which must be passed. After the industrial structure has been made more rational, development will be smooth.

3. The Question of the Relationship Between Domestic and International Trade: Will focusing on foreign trade lead to competition with domestic trade for supply of goods and adversely effect inland ties and supply to local markets? At present domestic trade in Guangzhou amounts to more than 8 billion yuan while foreign trade volume totals a mere one billion or so yuan, so its influence is not great. Some contradictions do exist in the expansion of exports and the supply of goods, but as long as production improves and popular, salable goods are manufactured, this will not matter too much. The current conflict is due to the fact that big profits can be made selling Guangzhou goods domestically, while foreign exchange conversion rates are not advantageous for exporting. However, we must continue to energetically provide political support and economic encouragement for the export trade. Another contradiction is that few commodities are left after export and the purchasing power of the remaining RMB is increased, which is not helpful in balancing local commodity supply and demand. Still, the present problem is not serious, as the state has increased the amount of foreign exchange that can be retained locally while decreasing the amount of RMB. Locally retained foreign exchange can be used to import raw materials and equipment. Locally manufactured

products not only can be exported, relieving pressures of domestic demand for sources of supply but can lead to increased volume of commodities available on the domestic market. In addition, it also should be noted that by greatly developing horizontal commodity relations, Guangzhou's total volume of local commodity supply and exports can be markedly increased while internal and external contradictions regarding sources of goods can be alleviated. With 26 provinces and cities across the nation having already signed over 900 contracts with Guangzhou, the city has achieved much in the realm of developing horizontal ties.

4. The Question of the Relationship Between the Coast and the Interior: Will the focus on foreign trade and international linkups with the interior increase the differences and contradictions between the coast and the interior? No it will not, because with the guidance of correct principles this relationship can be successfully dealt with, something which has already been demonstrated by the past several years of experience. Mutually beneficial cooperation can be strengthened between the coast and the interior as commodity ties between the two regions are improved. Our primary principle is: to adhere to equality and mutual benefit and rational prices. This is vital. The second principle is one of mutual development and prosperity. The third calls for the strict observance of contracts. Over the last few years we have opened up the city gates to allow agricultural by products and other products from the outside to enter, causing the supply of nonstaple foods and vegetables to Guangzhou to increase twofold in 1978, increasing the revenue of inland provinces, and enabling us to obtain many raw materials from the interior. An example would be the successful, mutually beneficial cooperation between Guangzhou's Huanan Sewing Machine Co. and Henan. In supporting Henan, Guangzhou received a contract guaranteeing the annual provision of 20,000 tons of coke for 30 years. We are not only providing the interior provinces with a large volume of light industry and specialty products, but can also improve economic and technological cooperation and distribute some of Guangzhou's advanced, superior technology into the interior to promote the development of inland commodity production and improve commodity quality. Many of these technological exchanges have been quite successful, have satisfied both parties and have led to even closer relations. In short, there are great prospects in store for ties and cooperation between Guangzhou and the interior.

JIANGXI DEVELOPMENT MEETING--The Jiangxi Provincial Society for Development of the Sanjianghu Areas held its third enlarged meeting from 6 to 22 May. During the meeting, professors, experts, and scholars from Jiangxi and other provinces conducted scientific surveys and offered on-the-spot guidance in Boyang Hu, the Gan Jiang basin, the Jinggangshan Nature Conservation Area, and the mountainous areas in southern Jiangxi. They also discussed questions related to the outline of the comprehensive plan for the development of the Sanjianghu areas. Provincial party and government leaders Wan Shaofen, Pei Dean, Zhao Zengyi, (Chen Guizun), and Zhang Fengyu and veteran Fu Yutian attended the meeting. VICE GOVERNOR ASSESSES SICHUAN'S INDUSTRY, COMMUNICATIONS

HK270730 Chengdu SICHUAN RIBAO in Chinese 12 May 85 pp 1, 4

[Report: "Do Everything Possible To Boost Industry and Communications Production"]

[Excerpts] A SICHUAN RIBAO reporter recently interviewed Vice Governor Pu Haiqing on the current situation in the province's industrial and communications production. Comrade Pu made the following remarks:

In the first quarter of this year, our province did not satisfactorily fulfill its production tasks for industry and communications. After much effort on the part of the government departments at all levels and the enterprises, industrial production was slightly better in April than it was in March, or basically the same as it was in the corresponding period of last year. However, total industrial output from January to April was still lower than in the corresponding period of last year.

The characteristics of industrial and communications production from January to April this year were as follows: Most localities fulfilled their industrial production tasks quite satisfactorily, with Suining, Zigong, Leshan, Liangshan, Deyang, and Nanchong registering an increase of over 10 percent, while a number of localities registered a sizable drop in production. Viewed from the conditions in various trades, the output of township enterprises rose considerably, but the output of the second light industrial enterprises dropped by 5.15 percent. The situation in transport and communications was fairly good. In April, the volume of rail freight and the volume of local goods transported by the three railway sub-bureaus in Sichuan increased over the corresponding period of last year. Electricity production gradually picked up and the peak volume of electricity generated in a day reached over 49 million kilowatt-hours in April.

The heavy backlog in industrial and communications production from January to April has made it more difficult to fulfill the production task for the whole year. However, we should be fully aware of the favorable factors in current industrial production: 1) The high water season will soon be here and electricity production will pick up very quickly. 2) After great effort on the part of the banks, the shortage of circulating capital has eased to some extent. 3) Some foreign exchange has recently been made available to import certain quantities of urgently needed raw materials. 4) The relatively satisfactory conditions in transport and communications, particularly in railway and water transport, can meet the transportation needs of various trades and industries. 5) The policies of invigorating the economy have gradually been refined and implemented. 6) All localities and departments have full confidence in fulfilling the industrial production tasks for this year. They pay close attention to industrial production and are adopting affective measures. As long as we make full use of these favorable factors and pay close attention to all fields of endeavor, it is entirely possible for us to fulfill the industrial production tasks for this year.

To make sure that the province's plan for industrial and communications production can be fulfilled, the governments of all levels, the departments in charge of economic work, and the leaders of all enterprises should persist in reform, rouse themselves, strengthen their resolve, and dare to take up responsibility and to tackle problems and to conscientiously strengthen leadership over industrial and communications production organizations. At present, it is necessary to carry out well the following tasks:

1. The departments in charge of economic work at all levels and the principal responsible comrades of various cities, prefectures, and autonomous prefectures should conscientiously analyze both the favorable and unfavorable factors in the economic development of their own localities and departments, go down to the grassroots units to conduct investigations and studies, adopt effective measures, direct production, and solve practical problems. They should not remain on the surface and talk in general terms. The economic commissions at all levels should take the initiative to solve various problems such as circulating capital, materials, the financial and tax contract system, rewards, and punishments, in coordination with the financial, taxation, banking, material, and labor and personnel departments.

2. Leading cadres at all levels should go down to the frontline to conduct ideological and political work and to persist in grasping the building of both spiritual and material civilizations.

3. We must persist in reform, protect the people's initiative for reform, and use reform to stimulate industrial and communications production. It is necessary to conscientiously implement the policy of consolidation, assimilation, replenishment, and improvement, to continuously adhere to the effective reform measures and the policies of invigorating the economy and enterprises, and to make further efforts to improve the imperfect. It is necessary to strictly implement various forms of the contract-based economic responsibility system and to honor commitments on rewards and punishments. Further effort should be made to implement the director responsibility system and to institute the system under which a director is responsible for fulfilling the set quotas during his term in office.

4. It is necessary to firmly grasp the production of readily marketable products and to expand the sales of locally manufactured goods. Where conditions permit, efforts should be made to increase the output of readily marketable products.

5. It is necessary to vigorously boost electricity production and to save on electricity. The electricity departments should tap existing potential and strive to generate more and stable electricity. They should also strive to purchase more electricity from other provinces. It is necessary to rationally coordinate the high electricity consumption season with the low and to use electricity in a thrifty and planned way so that our limited energy can play a greater role. We should pay close attention to the rate of progress and the commissioning of products under construction. The expansion of the Chongqing and Yizixi power plants should be speeded up in such a way that they will go into operation and generate electricity at an early date.

6. We should grasp the weak links, classify the problems in order of importance and urgency, and give them guidance. With regard to those localities and enterprises whose output has dropped and which are far behind in production, it is necessary to make studies and to adopt effective measures in order to solve the existing problems and to boost production. With regard to those localities and enterprises which give a good account of themselves in production, it is necessary to sum up and publicize their experience so that they will continue to forge ahead and scale new heights. With regard to key and readily marketable products, priority should be given in the supply of energy, raw materials, and funds in order to stimulate production. With regard to unsalable products or products kept long in stock, it is necessary to restrict or stop their production or to turn to other lines of production by stopping or restricting the supply of energy, raw materials, and funds. Energetic effort should be made to increase the output, purchase, and supply of crucial raw materials.

7. Vigorous effort should be made to grasp improvement of economic results and projects scheduled to go into operation this year. It is necessary to correctly handle the relationship between growth rate and economic results. While paying close attention to growth rate, we should strive to improve product quality, to reduce material consumption, and to lay emphasis on safety in production. It is necessary to practice target management to ensure the achievement of the objectives as scheduled. With regard to those projects scheduled to go into operation this year, we should firmly grasp their rate of progress so that they can be completed and commissioned at an early date.

May and June are the prime months in industrial and communications production. It is necessary to step up production management and to concentrate our energy on boosting production in order to lay a good foundation for the fulfillment of the plan this year.

XINJIANG HOLDS MEETING ON UTILIZING FOREIGN FUNDS

HK240808 Urumqi Xinjiang Regional Service in Mandarin 1200 GMT 21 May 86

[Excerpts] The regional meeting on the work of utilizing foreign capital, which concluded this afternoon, decided that in utilizing foreign capital in the future we should stress the development of advanced technology of a productive nature which is needed in the course of exploiting and building Xinjiang, vigorously develop projects that can earn foreign exchange, and do everything to invigorate Xinjiang's economy.

The meeting held: During the Sixth 5-Year Plan period, our region made a good start in utilizing foreign capital. All places and departments must further free their minds and be bold in carrying out exploration so that our region can make new breakthroughs in utilizing foreign capital.

The meeting pointed out: Utilization of foreign capital is an important aspect of the national economy. We must strengthen macroeconomic control and planned management. Proceeding from the overall interests of the region, in accordance with their practical requirements, all places and departments must formulate an overall plan for utilizing foreign capital.

The meeting demanded: Projects that utilize foreign capital must be carried out in accordance with the procedures of examination and approval, and in accordance with legal procedures. It is essential to perform the feasibility studies of the projects well and to make good preliminary preparations.

It is imperative to link the utilization of foreign capital with the technological transformation of existing enterprises to promote their technological progress.

Leaders of the region, including Comrades Zhang Sixue, Qi Cuo, Huang Baozhang, Hede Erbai, and (Jin Niuhui), attended the meeting and spoke.

GANSU HOLDS MEETING ON URBAN ECONOMIC REFORMS

Governor Stresses Lateral Ties

HK220615 Lanzhou Gansu Provincial Service in Mandarin 2200 GMT 21 May 86

[Excerpts] Governor Jia Zhijie said: To develop and invigorate Gansu's economy, we must make a breakthrough in developing lateral economic ties and find new ways that require little investment and a short cycle and produce quick results. He gave this view at the first provincial conference on urban economic structural reform, which opened on 21 May.

He said: Gansu has very great potentials for lateral ties and economic development. However, the key to whether the potential can be translated into actual economic strength lies in our work performance. There are two possibilities and two kinds of future: 1) becoming poor through guarding our potential, and begging with a golden bowl; and 2) working hard to take advantage of our strong points and tap our potential, promoting ties through opening up, and invigorating the province's economy through developing ties. We can only choose the second. We must pioneer new roads, create new experiences, and put forward new demands in lateral economic ties.

This conference, convened by the provincial CPC committee and government, will sum up and review the progress of urban reforms in the past few years, analyze and study the tasks of urban reforoms in the new circumstances, and focus efforts in making arrangements for lateral economic ties.

Xu Feiqing, chairman of the provincial People's Congress standing committee, vice governors Liu Shu and Zhang Wule, and responsible comrades of departments concerned, including the provincial economics commission, attended the opening of the conference.

Governor Jia Zhijie said in his speech: Diffusion and joint operations are becoming a new factor in the province's economic growth that we cannot neglect. According to statistics, in 1985 the province completed 209 diffusion and joint operations projects with a total output value of 340 million yuan, a rise of 125 percent over 1984.

Jia Zhijie continued: Generally speaking, the province's lateral economic ties have made a start along the road. Apart from achieving a certain degree of economic results, we have also explored some forums with Gansu characteristics. There are great prospects for developing lateral economic ties in Gansu. There are broad fields and potential for this work. We have all kinds of potentials. Strong points are potentials. Weaknesses are also potentials. There are actual potentials and also latent strong points. We must therefore break through narrow-minded regional and departmental concepts, discard conventional vertical and horizontal bindings, further emancipate our minds, relax the policies, and ensure that economic ties can progress through many channels, in many forms, at many levels, and in all directions. We should organize some enterprise groupings that have the nature of consortia.

Jia Zhijie also introduced some initial ideas of the provincial authorities. He said: The main goal of the lateral economic ties plan for the 3 years 1986-88 is to organize 502 joint operations projects, with an output value of 1,668 milllion yuan and producing 311 million in profit and tax; the goal of endeavor for 1986 is to organize 265 joint operations projects with an output value of 508 million yuan and producing 89 million yuan in profit and tax. After these goals are attained, the province's economic strength will be further boosted, the rapid development of industrial and agricultural production will be promoted, and the people of the whole province will derive still greater real benefit.

Vice Governor Views Development

HK260415 Lanzhou Gansu Provincial Service in Mandarin 2200 GMT 25 May 86

[Excerpts] The Gansu provincial conference on urban economic structural reform concluded in Lanzhou on 25 May. Governor Jia Zhijie presided at the meeting. Vice Governor Zhang Wule gave some views on further developing lateral economic ties:

1. We must bring into further play the main force role of large and medium enterprises in lateral economic ties. Such enterprises should regard stimulating the ties as a task for which they should be responsible in invigorating Gansu's economy.

2. Key cities should further play a main factor and pivotal role in lateral economic ties. The current urgent task is to establish and open up markets of all types to provide coordinated services in production and daily life materials, small commodities, capital, labor, science and technology, and information.

3. The government departments should shift their functions and provide coordinated services in lateral economic ties while also providing macroeconomic guidance. They should guide the enterprises to switch from the production form of being small but complete to specialized production.

4. We must further speed up our pace of opening up to the world. This involves opening up to other places in the province as well as to other parts of the world. Through forging ties with other provinces and

municipalities, we should not only improve the quality of our enterprises, but more important, acquire advanced technology and experiences and train our own talented people.

5. We must focus on key points and vigorously firm up the 3-year plan for developing lateral economic ties. At present we should concentrate on projects that can produce results this year.

CONFERENCE DISCUSSES ECONOMY OF SOUTHWESTERN CHINA

Five-Party Meeting Held

HK231058 Kunming Yunnan Provincial Service in Mandarin 2200 GMT 22 May 86

[Text] During the third session of the five-party economic coordination conference, representatives of various parties discussed the major issue of rejuvenating the economy in southwestern China. The participants held that we must make good use of the present good situation in developing lateral economic ties, and promote the development of lateral economic ties among the five parties to a new level.

During the session, the representatives expressed their views and made useful suggestions on major and strategic issues concerning the five parties. The conference was marked by equality, unity, and cooperation.

(Xia Feng), vice chairman of the Chongqing City Economic Cooperation Office, said: The ties among enterprises are the basic form of the lateral economic ties, as well as the focal point of development. The five-party economic coordination conference should overcome obstacles for enterprises in the areas of establishing ties, so that they can dispel their worries and go all out in the work. Presently, we should resolutely implement the State Council stipulation on further promoting the lateral economic ties. In connection with our actual conditions, we should consciously do well in the work.

(Zhang Jiabin), vice chairman of the Guizhou Provincial Economic Office, said: It is very important that the five parties support each other. In the wake of further development of the ties among us, we should discuss the formation of economic combines, and group together the major, minor, long-term, and short-term projects so that we can achieve more in lateral economic cooperation.

(Huang Ziji), vice chairman of the Quangxi Regional Office for Transforming Enterprises, said: The five-party economic coordination conference must make decisions and plans for major issues, such as the development of the basin of the Hongshui He, and building the Lanzhou-Kunming Railway. It should strengthen macroscopic guidance in the area of lateral economic ties, and provide good services. We should promptly make arrangements for dealing with some issues, so that the lateral economic ties will be developed healthily.

(Zhou Mingju), vice chairman of the Sichuan Provincial Economic Coordination Office, took the cases of Sichuan and Yunnan as examples for showing the achievements of developing economic and technological cooperation. He said: Last Year, Sichuan and Yunnan were linked together. Most economic cooperation projects jointly run by Chengdu and 11 prefectures, autonomous prefectures and cities, and Yunnan have been the successful ones. Furthermore, the provinces now plan to establish a long-term and stable cooperation relationship between Dukou City and western Yunnan.

(Huang Hengqiu), deputy head of the Yunnan Provincial Department for Rural Work, said: In the past, the economic coordination conference only discussed matters concerning industry and commerce. This conference, however, discussed the issue of developing the natural deposits in subtropic and tropical areas in southwestern China. This has raised the issue of agriculture to the level of economic ties and coordination, which is a good move. The five parties should make joint efforts and do well in investigation and planning.

Concerning the strategy for comprehensive surveying and developing the natural resources of southwestern China, the participants held that this is a strategic task that attracts great attention from the party, state, and the peoples of various nationalities. It is also very important preparatory work for developing southwestern China. The parties should coordinate with each other, give play to the roles of central and local authorities, and quickly achieve results.

Concerning the practice of taking a further relaxed attitude toward policies and giving supports to focal points in areas inhabited by minority nationalities, the participants said: The five parties have a total minority nationality population of over 37 million, accounting for some 60 percent of China's total population of minority nationalities. Comparatively speaking, the economy and culture in the areas are still backward. Thus, the state should adopt special measures to help quicken the economic development of areas inhabited by minority nationalities. The present focal point of the work is to help those severely poverty-stricken areas use the local advantages to develop production by self-reliance, thereby gradually improving the people's living standard.

Economic Coordination Conference Concludes

HK250331 Kunming Yunnan Provincial Service in Mandarin 2200 GMT 24 May 86

[Excerpts] The third session of the economic coordination conference of Sichuan, Yunnan, Guizhou, Guangxi, and Chongqing victoriously concluded in Kunming on 24 May after completing all its agenda. The meeting was held under the close concern of the CPC Central Committee and State Council. Pu Chaozhu, chairman of the session and secretary of the Yunnan Provincial CPC Committee, presided and made the closing speech.

This session was held in a new situation since the state's seventh 5-year plan has listed the three provinces, one autonomous region, and one city of the southwest as one of the five grade-one economic zones in the country, and the central authorities are regarding lateral economic ties as an important component part of economic reform. During the session, responsible comrades of the central departments, well-known figures, experts, and scholars put forward a number of very good and sincere suggestions and views. They incisively elaborated on the importance and prospects in developing lateral economic ties. This played an important guiding role in making a success of the session.

The session held: At present the key to economic development in the five conference members lies in vigorously grasping circulation, communications, capital flow, and energy, and in working hard to assign joint undertakings and developing an important strategic position and to build a regional market setup among the five members, as a contribution to promoting the establishment of a unified socialist market setup in the whole country.

During the session, as a result of the common efforts of all parties, on the basis of summing up previous experience and in light of developments, the participants revised, discussed, and approved a number of principals for the economic coordination conference, some views on vigorously promoting multilayer lateral economic ties, and other documents. Agreements were reached on 228 cooperation projects.

The meeting decided that, since the Xizang Autonomous Region has been formally accepted as a member of the economic coordination conference, the next session will be a six-party affair, with the participation of three provinces, two regions, and one city.

ECONOMIC MANAGEMENT

CHONGQING LEADER DISCUSSES ECONOMIC COOPERATION

HK250307 Kunming Yunnan Provincial Service in Mandarin 1000 GMT 24 May 86

[Excerpts] On 22 May, Huang Ye, leader of the Chongqing delegation and vice mayor of Chongqing, made a speech at the five-party economic coordination meeting, in which he introduced the development of Chongqing's economic ties and cooperation with the other parties since the last session of the conference and put forward ideas on the future development of lateral economic ties.

He said: Chongqing is a comprehensive industrial city. Its economy will develop still faster when the economy of the southwest provinces and regions has developed. With its economy developed, Chongqing can also provide better service for the economic development of the southwest provinces and regions. In the past few years, Chongqing enterprises have signed agreements on 256 cooperation projects with enterprises elsewhere in the region, and 150 of these are now underway.

Huang Ye also said: After this session, Chongqing will open its gates wider and advance in big strides. We will develop economic, scientific and technical, and social ties and cooperation in all fields and take lateral economic ties to a new stage. 1) We should seriously firm up the agreements discussed and decided on by this meeting. 2) We should further develop ties and cooperation between trades. 3) We should further establish and develop markets for production and daily life materials, technology, finance, and labor, and gradually form a complete marekt setup. 4) We should step up exchanges of technology, culture, and information. 5) We should improve and strengthen service work and create a very good environment and conditions for developing lateral economic ties. 6) We should reform the financial management system to stimulate the development of lateral economic ties.

HENAN PLANNING GROUP VIEWS INDUSTRIAL PERFORMANCE

HK250651 Zhengzhou Henan Provincial Service in Mandarin 1130 GMT 24 May 86

[Excerpts] The provincial planning and economic commission held a production direction conference on 23 May, which proposed that the target management responsibility system be established in economic work in all prefectures, cities, and departments and bureaus concerned, to ensure the fulfillment of the province's industrial production task this year.

Zhong Lizeng, chairman of the commission, said at the meeting: The province's industrial output value in the first 4 months of the year showed a rise of only 0.2 percent over the same period last year. Economic results declined somewhat. In order to resolutely promote industrial production, it has been decided to institute the target management responsibility system in economic work in all prefectures, cities, and departments.

Beginning in May, the provincial government will periodically examine the production performance not only of the prefectures and cities but also of the departments and bureaus concerned. The provincial government will commend those units fulfilling their target management goals and will reward enterprise leaders who overfulfill their goals.

Zong Lizeng also announced 10 other measures for grasping industrial production. The important ones are: Persevere in reform; increase output of products in market demand; continue to solve the shortages of electric power, raw materialas, and capital; do a good job in sales of products; improve the coordination of industry and commerce; strengthen control over production; and promote labor emulation.

Vice Governor Gin Kecai also spoke at the meeting. He said: The plan to increase industrial output value by 8 percent this year was approved by the recent fourth session of the sixth provincial people's congress. We must make every effot to achieve this target. It is essential to have a certain growth rate in industry.

HUNAN'S XIONG GINGQUAN REPORTS ON ECONOMIC WORK

HK250557 Changsha Hunan Provincial Service in Mandarin 0900 GMT 24 May 86

[Excerpts] In his government work report, Governor Xiong Gingquan spoke on specific measures in the province's economic work this year, stressing the importance of actively developing lateral economic ties. These can promote reform as well as economic results. He also proposed 10 aspects of Hunan's development of lateral economic ties:

1. Expand ties with Shanghai, Beijing, Guangdong, and neighboring provinces, with the focus on bringing in capital, technology, management, and talent, so as to exploit Hunan's rich resources and improve its production, technology, and management standards.

2. Develop a number of enterprise groupings or consortia with the focus on brand products, centered on large and medium enterprises and on the machine building and electronics industries.

3. Actively develop a number of industry-commerce, agriculture-commerce, commerce-commerce, and industry-agriculture-commerce combines spanning different sectors and regions.

4. Strengthen ties between the towns and countryside, especially between urban and township enterprises, so as to promote the structural reform by which cities administer counties, and speed up the integration of the urban and rural areas.

5. Speed up ties between military and civilian industries and between developed and undeveloped areas, to stimulate the transfer of technology and rational mobility of talented people.

6. Get a good grasp of ties between Changsha, Zhuzhou, and Xiangtan, and gradually create a new situation in this tri-city economic cooperation zone.

7. Actively develop ties between foreign trade units on the one hand and production units, domestic trade units, and ports, on the other hand, to achieve unity in opening up to the world.

8. Actively organize cooperation between financial enterprises and vigorously develop the lateral flow of capital.

9. Further develop scientific research and production combined composed of scientific research centers, institutes of higher education, and production enterprises.

10. Actively develop joint transport by railroad, road, and waterway, and strengthen joint transport operations with fraternal provinces and cities.

On grasping this year's economic work, Governor Xiong Gingquan stressed that it is essential to do a good job in market supply and to maintain basic price stability.

He pointed out: Prices are an issue of greatest concern to the masses. Jurisdiction over price readjustment must be centralized. No department may arbitrarily propose price hikes, or indulge in devising price-hiking schemes. In general, prices of products involving the overall urban and rural situation should not be altered this year. In particular, we must strengthen controls over the trading markets and traders and hawkers. If necessary we should stipulate the varieties of goods subject to price controls and the range of price fluctuations. We must do everything possible to maintain basic price stability.

Governor Xiong Gingquan stressed: We must unswervingly build the two civilizations together and strengthen the building of socialist spiritual civilization and the legal system.

He also said: An important issue in building socialist spiritual civilization is to wage the struggle against all ignorance and feudal superstition. At present, feudal superstitions and clan activities have emerged to some extent in part of the province. We must pay sufficient attention to this problem. Cultural undertakings such as literature, art, journalism, publishing, radio, and television must insist on putting social benefits in first place and stand in the forefront of building socialist spiritual civilization.

ECONOMIC MANAGEMENT

JILIN HOLDS CONFERENCE ON REFORM, ECONOMIC WORK

SK281328 Changchun Jilin Provincial Service in Mandarin 0930 GMT 27 May 86

[Text] The provincial conference on the economic structural reform and economic work was held in Changchun this morning. Major tasks of the conference were to work out ways to further implement the guidelines of the national economic work conference and the national urban economic structural reform conference convened by the State Council, to study ways to continuously deepen the economic reform of our province, and to make arrangements for developing the overall lateral economic cooperation, strengthening enterprise management, implementing the policy of attending to the two civilizations simultaneously, and conscientiously reinforcing the ideological and political work of enterprises.

Vice Governor Gao Wen presided over the conference. Governor Gao Dezhan delivered a speech: "Persistently Carry Out Reform, Develop Cooperation, Strengthen Management, and Stimulate a Sustained, Stable, and Coordinated Development in the Economy of Our Province."

Governor Gao Dezhan pointed out in his speech: The focus of our province's reform this year should be placed on the promotion of the overall lateral economic cooperation. Through cooperation, we should continuously deepen the reforms and promote the economic structural reform. While carrying out cooperation, we should further enhance our understanding, emancipate our minds, and free ourselves from the shackles of outmoded systems. We should proceed from reality to make overall plans, give positive guidance, and carry out extensive multi-layer and multi-channel cooperation of various forms and in various fields with the focus on the established priorities. We should work out plans to conduct cooperation whenever conditions are ripe. We should strengthen leadership, encourage lateral economic cooperation with policies, and protect it with laws.

Governor Gao continued: On the basis of the guidelines of the national economic work conference and the actual conditions of our province, we should regard enterprise management as a strategic measure, and carry it out during the Seventh 5-Year Plan period. We should improve economic benefit and increase our strength through better management. While improving enterprise management, we should lay a good foundation, and improve it step by step to achieve overall improvement. Every enterprise should base itself on the present level, and take three steps to achieve improvement in its basic work, leading body, as well as professional and modernized management. High standards, high quality, and strict requirements should be upheld when upgrading enterprises.

Governor Gao Dezhan concluded: We should adhere to the orientation of reform, clarify the bounds of policies, enforce and improve in a comprehensive manner the economic responsibility system within enterprises, fully arouse the enthusiasm of producers and distributors, and, on the premise that state policies are conscientiously carried out, implement our province's specific policy measures in an all-round manner with an end to upgrade the quality of products, reduce consumption, conserve funds, lower cost, produce more readily marketable products, expand sales, dispose of goods in stock, activate funds, stop deficits, and increase profits so that enterprises can give play to their initiative, and enhance their ability for self-development.

Leading departments should enforce the systems under which they should be responsible for fulfilling certain goals and establish ties in carrying out their work, render goods service to invigorating enterprises, and regard the service as an important criterion for evaluating cadres. While attending to economic work, we should conscientiously strengthen the ideological and political work of enterprises, implement the policy of promoting the two civilizations simultaneously, continuously raise the level of this work, and exert painstaking efforts to make it lively and successful. Enterprise cadres in charge of political work should have confidence in, respect, and improve themselves, win the trust of the party and the masses with creative work, and make contributions to the building of the two civilizations.

Attending the conference were responsible comrades of various cities, prefectures, the autonomous prefecture, and counties; economic structural reform commissions, planning and economic commissions, and economic cooperation offices at all levels; various provincial committees, departments, bureaus, and offices; and some key enterprises. Pertinent responsible comrades of the provincial CPC committee, advisory commission, CPPCC committee, and discipline inspection commission also attended.

ECONOMIC MANAGEMENT

JOURNAL ON SELF-FINANCING IN FOUR MODERNIZATIONS

HK270138 Beijing JINGJI QUANLI in Chinese No 4, 5 Apr 86 pp 22-24

[Article by Zhang Shizong [1728 1709 1813], edited by Pan Shucheng [3382 6615 3397]: "Fully Enhance the Role of Self-Financing in the Four Modernizations"]

[Text] I.

Whether enterprises possess strong vitality is a big problem related to the whole situation of the development of the national economy. Over 80 percent of our state revenues are derived from the profits and taxes of industrial enterprises; hence, invigorating the enterprises is an important measure to nurture the financial resources of the state, increase the strength of the state, maintain economic stability, and coordinate development. Following the progress of the reform of the economic structure, industrial enterprises have obtained not only decisionmaking power in operation but also a definite amount of self-retained funds which they can autonomously dispose of. The self-retained funds of enterprises and the financial strength of the regions and departments have formed large and powerful self-raised funds. The investment activities of self-raised funds have changed the former situation of construction funds wholly dependent on financial appropriations from the state, strengthened the capacity of the enterprises in self-transformation and self development, and have played an increasingly important role in the country's socialist construction.

According to statistics of Fushun City, between 1981 and 1984, the sources of funds of fixed asset investments were: state financial appropriations, 25 percent; self-raised funds, 58 percent; and the balance composed of bank loans (12 percent) and sundry funds (5 percent). In structure, fixed asset investments have also evolved in a rather great way. Fifty-five percent of fixed asset investments during the 4-year 1981-1984 period were investments on technological transformation projects, whereas capital construction investments comprised only 45 percent. Thus, the original emphasis on capital construction in fixed asset investments has gradually shifted to transformation of the original technologies of the enterprises.

Generally speaking, investments of self-raised funds have the special features of small projects, little investment, short construction periods, and quick results. They have usually obtained comparatively good economic results. Fushun's industrial gross output value in 1984 increased by 19.48 percent over 1981, and the total amount of profits and taxes increased by 24.42 percent. At the same time, self-raised funds were used to build a large number of residences for the staff members and workers. The total area of residences built and completed during the 1981-1984 period was 2.4234 million square meters. This has clearly improved the housing conditions of the staff members and workers.

II.

In exploring the problem of the scale of fixed asset investments, some people have expressed the opinion that the over-large scale of investments in recent years was due principally to the investments of self-raised funds being too rapid and too large in amount. They believed that in the investment of self-raised funds, there were the phenomena of building blindly, redundant construction, and waste of funds. Hence, they held that the investment activities of self-raised funds should be subject to control, and that the restraining measures should include tightening the money market, tightening the granting of loans, raising interest rates, levying higher and heavier taxes, and so on. However, I do not believe we should adopt such measures.

1. Regarding the problem of the scale of investments. The scale of investment is a problem we must look into in economic construction. The size of investment depends on the plan. The plan is determined on the basis of the state's ability to bear, following the process of comprehensive balancing. It is a yardstick of whether the scale of investment is adequate. Problems arising in the course of strictly implementing the state plan may be ascribed to errors in planning. Regarding the undertaking of projects that exceed the state plan, the personnel in charge of whichever department responsible for it should bear the burden.

It is not easy to talk clearly about scale in deviation from plan. For example: 1) The state prescribes a score of projects without specifying their scale. In the statistics, they should be included in the volume of completed fixed asset investments, but in the completed volume what should be the amount of those not specified? This is not at all clear. 2) It would not be correct to consider the scale as being overly large if there were a slight increase in the volume of completed projects this year over the preceding year. Following the development of the economy and the rise in national income, it is quite normal for the volume of fixed asset investments to increase each year. We should not in general suggest that the increased portion was out of control. 3) Due to the supply of certain major construction materials lagging behind demand and showing repeated price rises, and also due to the levying of the construction tax, construction costs have been rising yearly. During the 1950's, the construction costs of residences was only around 100 yuan per square meter. It is now double that figure. Even though there is change in the volume of construction materials in kind, the completed volume of investments has increased year after year. In particular, in recent years, this situation of increase can be readily discerned.

In short, many factors contribute to the increase in fixed asset investments. To what extent will investment of self-raised funds contribute to this increase? Let us make a concrete analysis.

2. It is a fact that as a result of the state implementing the policy of delegating power and invigorating [enterprises] the self-retained funds of the enterprises have gradually increased, but not to the extent that the investment activities by the use of self-raised funds have overflooded the market and must be attended to at once. I believe that this is hardly the case. According to current needs, the self-retained funds of enterprises are actually not too much, but are too scarce. In particular, in the technological transformation of the old enterprises, the major problem at present is still the insufficiency of funds. Even in regard to the projects carried out in the past, the method adopted was: "The enterprise paying a little, the state or department supplementing a little, the locality providing a little, and the bank loaning a little." Under such conditions, to tighten the money market and to depress loan-granting would be tantamount to "taking away the firewood from under the cauldron."

In undertaking construction through the use of self-raised funds, the burden currently faced by the enterprises is not at all light. It includes payment of the energy and communications subscription funds, construction tax, and various kinds of levies and collections. In addition, the major construction materials required for construction are mostly procured at negotiated prices. On such a foundation, if we are to levy higher and heavier taxes, or raise the interest rates on loans, it will only make the amount of available self-raised funds insufficient for the purpose. This not only will strangle the enthusiasm of the enterprises and of the localities but also run counter to the series of guidelines and enterprises calling for "releasing from bondage", "delegating power", strengthening the enterprises' vitality, and invigorating the economy.

3. With regard to the problem of blind construction and redundant construction. This is a problem which we must overcome in our socialist construction. But the appearance of this kind of problem should not be ascribed to the fault of the investment activities in self-raised funds. Surely, we cannot say that using self-raised funds in construction will bring about blind construction and redundant construction but that using other sources of funds for the same purpose will not cause such phenomena. The problem does not lie in the source of the funds but rather in the degree of correctness in studying and determining the feasibility of the investment projects.

Naturally, projects undertaken by the use of self-raised funds are mostly determined on the basis of the supply and demand within the locality, the industry or trade, and the market, and then measuring the extent of the benefit that the enterprise can derive therefrom. Therefore, a certain degree of control is unavoidable. However, among a large number of projects financed by self-raised funds, due to deviation from time schedules and changes of conditions, errors in individual projects are unavoidable. Even though blind construction and redundant construction have appeared, because they are projects generally requiring small investment, no really important impact can be felt on the situation as a whole. With the law of value playing its due role, these projects can speedily go into production and generate new effects. In reality, to prevent the rise of such problems, the key lies in learning from, and absorbing, past lessons. Construction units should note market information, step up feasibility studies, and overcome blindly selecting projects for investment. At the same time, we should step up macro-guidance, and should never give up eating for fear of choking.

III.

In view of self-raised funds occupying an increasingly important position in fixed asset investments, it is necessary to guide the direction of their investment, to the end that the flow of investments is more rational and more in conformity with the demands of the whole situation.

1. The investment activities in self-raised funds should, like other construction funds, be incorporated into the state's unified plan. The plan should be divided into two portions: large and medium-sized projects should come under the state's direct control, while others should be graded and cut piecemeal into separate control targets to be assigned to the departments in the localities, enforcing the department-or-plant-chief responsibility system. By so doing, it is beneficial to the state in carrying out a comprehensive balancing in personnel, finance, and materials, and also prevents the gross scale of fixed asset investment being out of control.

Nevertheless, in the state plan, how to handle well the relationship between major construction and rank-and-file construction is an exceedingly important problem. Major construction, particularly construction in the energy and communications sectors, is a big affair related to the development of the national economy. Failing to make any headway in major construction means that the whole national economy cannot be invigorated and even partial development will naturally be restricted. But it is also true that major construction should not, within a designated period of time, progress at a pace of the faster the better.

Major construction must conform with the national strength, otherwise, not only major construction cannot make any headway but also large amounts of materials and money will stay in a "half-spent state", in addition to elbowing out certain small construction projects which requirre little investment, and call for a short construction period but produce quick results. A major construction project costs an investment outlay ranging from as little as several hundred million yuan to as much as several billion yuan, whereas investments in small projects require only a little over 100,000 yuan each or several hundred thousand yuan each and only a few of the larger projects require at most some several tens of million yuan.

The relationship between these two categories of projects is akin to that between "a single item" and "a cluster of items". Undertaking one more major project means elbowing out a large cluster of rank-and-fiile small projects, whereas undertaking one less major project means enlivening a large cluster of small projects. Hence, we must be extremely cautious in decisionmaking concerning major construction projects. Indeed, the state should firmly control the number of major construction projects and, at the same time, under the precondition of seeking prompt benefits, liberally stimulate investment in small projects. By so doing, we are in conformity with the principle of "macro-control and micro-invigorating," and can enable the structure of fixed asset investment to maintain an appropriate proportionate relationship.

2. In order to guide self-raised funds to play an even greater role in national construction, we should change the method of the state taking unified control of undertaking major construction projects. Rather, a number of major construction projects which call for little investment, produce good results, and engender large profits should be turned over to the regions and departments for them to take charge by raising the requisite funds themselves. As for the road to raising funds, we should break the demarcation line between regions and industries and trades, enforcing the principle of whoever invests enjoys the benefits and the profits. Thus, the enthusiasm of investors on various sides can be aroused, and the green light is turned on for the lateral flow of self-retained funds.

We believe that certain regions and enterprises, for the sake of seeking their own self-development and protecting the source of energy and raw material, are perfectly willing to invest. Naturally, the methods of raising funds are many and diversified, such as undertaking domestic compensation trade, issuance of stock certificates and bonds, and so forth. In order to remove the skepticism and doubt of investors, the relevant departments may adopt suitable measures to bear certain of the risks in investment. On the basis of raising the requisite funds and working according to the concrete conditions, the state may make certain supplementary contributions or the banks may advance small bank loans. By so doing, the good points are: 1) Arousing the enthusiasm of many sides; this is naturally much better and can earn quicker results than merely counting on enthusiasm from only one side. 2) Lightening the financial burden of the state, through using the money for one project to finance and undertake several projects; the money thus saved can be concentrated and used on projects which yield minor profits or no profits at all, or used on large scientific research, cultural, educational, or public health projects.

3. We should further expand the sources of self-raised funds. In our country, we have a relatively large number of old enterprises and are very much confronted with the vexing problems of antiquated equipment, backward technologies, and aging products. The tasks of technological transforamtion are indeed very heavy ones. Such a huge demand for funds cannot be met by the self-retained funds of the existing enterprises. How then should the problem of the source of funds by solved? We may suggest that with respect to those major products the supply of which is currently lagging behind demand, such as rolled steel, aluminum ingots, cement, and electricity, a suitable rate of the products development funds be collected from them, in addition to their out-of-factory prices, to continue for a stated epriod of time (say, up to an improvement in the situation of supply lagging behind demand). The funds thus

collected should be deposited in a bank under a special name, designated for special use only, and subjected, in accordance with the respective subordinate relationship, to the unified arrangements for use by the relevant departments in close adherence to the development plans of industries and trades. By so doing, each year the country as a whole can collect a rather sizable amount of funds for use in the development of the various products concerned. Such a method exerts a certain restraining force on macro over-demand and, simultaneously lessening demand, it can vigorously develop production and increase supply. It also conforms to the principle of "products for everybody's use, and everybody bearing the burden of opening up products," and "taking from the people and using same on the people."

ECONOMIC MANAGEMENT

BRIEFS

GUANGDONG'S YE XUANPING ON COUPONS--At today's 5th session of the 6th Provincial People's Congress, Ye Xuanping said in his report: During the Sixth 5-Year Plan period, the province's urban and rural markets were brisk. The supply of commodities was rich in variety and the supply of such fresh commodities as vegetables, fruits, poultry, meat, fish and eggs was abundant. Also, the amount of vegetable and fish being transported to north China was increased year by year. Except for some products, the articles for daily use as well as the durable consumer goods were available in the open market. In 1975, the province issued more than 40 kinds of coupons for purchasing products. But now these coupons are needed only when purchasing grain, oils and coal. GUANGZHOU'S FINANCIAL REFORM DISCUSSED

Beijing JINGJIXUE ZHOUBAO [ECONOMICS WEEKLY] in Chinese 5 Jan 86 p 2

[Article by Lin Qixiang [2651 0796 4382] the Guangzhou Economic and Social Development Research Institute: "Guangzhou's Reformed Financial System"]

[Text] [Summary] Guangzhou City has achieved much success in the last few years in its implementation of the "open door, reform, and enliven" principle. With the initial stimulus of the "enliven the circulation" reform of the system of circulation, the commodity economy has developed rapidly. However, the financial system, in particular the system of management over credit, is still behind the times, which hinders the further development of the commodity economy. The old financial system has become a "bottleneck" blocking the overall reform and the development of the commodity economy in Guangzhou at the present stage. Breaching the gap via "enlivening finance," reforming the financial system, deepening the overall reform and perfecting economic mechanisms are urgent tasks in the current reform of Guangzhou City. [End of summary]

Objectives

The objective for the reform of the financial system is to set up a lively, orderly financial market that is adjustable and controlable. With effective macroeconomic control over the market, integration between planning and market mechanisms and freely flowing channels of capital, we can more efficiently promote the development of the commodity economy compared to the present directive financial system. The following practical objectives must be realized, including the completion and strengthening of the central banking function of the Guangzhou City People's Bank, so that it can genuinely become the core of the city's financial system: the development of the "credit middleman" role of specialized banks, which at the grassroots level must implement "professional enterprise management"; the opening up of credit channels, the creation of financial enterprises of differing functions, the development of financial resources; the development of diversified credit forms and instruments for the circulation of credit; the full utilization of economic levers, in particular interest rates, to regulate the distribution of the national income and direct the flow of credit funds; striving to create the necessary conditions so that Guangzhou can become the financial center for southern China, Guangdong Province and the Zhu Jiang delta; gradually developing international financial operations.

Implementation and Coordination

1. The Reform's Principle of Implementation

A currency policy involving tightening up the money supply must be implemented throughout the course of the financial reform. The reasons for this are: First, only with such a policy can financial enterprises emphasize the effective investment of capital, increase returns on credit funds, and enliven themselves. Second, it would encourage industrial and commercial enterprises to look within and pay attention to their own internal accumulation, developing potentials, cutting down on expenditure, and increasing the capital turnover rate and to enable the entire economic ssytem to share in the benefits of the financial reform which is a part of the overall reform. Third, macroeconomic control could be enhanced, commodity price increases due to the readjustment of the interest system as part of the reform could be prevented, and the reform of the interest system and the readjustment of commodity prices caused by it could be restricted to within the framework of structural revision.

2. The Initial Stage of Financial Reform

The first steps of the reform of the banking credit system of management must first not influence or disturb work to balance credit nationwide. Second, grassroots banks must separate professionally and in terms of economic returns from the vertical control of supervising specialized banks. Conditions needed for reform of Guangzhou's banking and credit system could be created by the method of "separated contracting and each to balance their own books." Business administration of banks must be made more professional and their autonomy should be expanded. At the same time, a system involving the retention of profit by the city's specialized banks must be implemented, and a long-term credit fund market must be set up. There are two ways to accomplish this: (1) Have the various financial organs such as banks, trust companies, finance agencies and insurance companies utilize a variety of methods to concentrate capital dispersed throughout society for use in production investment; (2) The absorption of capital by the issuance of negotiable securities on the market by final borrowers, such as industrial and commercial enterprises and government organs. We should also further expand the use of foreign exchange retention to adjust the market. While reforming the banking system, we must focus on developing various types of financial organs and diversified forms of credit and invigorate the circulation of short- and long-term funds. We must strive to promote the use of bills and notes in commercial credit and allow some economically diversified financial institutions of all categories, such as banks that specialize in attracting foreign capital, to establish joint-venture banks, urban credit cooperatives, and collective banks, regional development banks, and insurance companies. Private credit and direct credit activities among industrial and commercial enterprises must be legalized on a foundation of improved management.

Use the method of "integrating regulation with the open door" to reform the interest and management systems. In the initial stage of the reform, due to the lack of competition among banks, there are many distortions in the current system of commodity price and a lack of fidelity to varying degrees in price signals. Therefore, the scope of the reform of interest rates should not be too great to avoid the inflation and loss of control over the investment structure that would be caused by the resulting increased product costs. A more realistic idea would be: state banking system interest should be "primarily regulated, with an integration between adjustment and liberalization"; based on a foundation of management, interest of nonbanking financial organs should be "primarily opened up." Residents' savings deposits and intraindustrial credit interest should be "primarily opened up;" enterprise savings and interest on credit should be characterized by an integration of regulation and fluctuation. Long-term credit is to be "primarily regulated"; medium- and short-term credit shall fluctuate within currently stipulated bounds. Currently the most irrational of the interest rates for credit funds are long-term loan rates which are too low, even at irrational rates. Therefore, with the exception of a minority of funds to be used on key construction projects that are economically effective for which favorable rates can be guaranteed, interest rates for most long-term loans need to be gradually raised. Rates for medium- and short-term loans should not be loosened all at once in order to avoid a great increase in the cost burden of enterprises.

The focal point of the reform of the financial system entails the further reform of the price system, the creation and completion of economic laws and the strengthening of economic responsibility among all economic organizations and enterprises.

3. Advancing the Reform Via Intraindustrial Competition

There is a direct proportionate relationship between competition and the strength of an enterprise. The second stage of the financial reform requires continuing to encourage competition in financial circles, particularly among banks. In the initial stages of the financial reform, interest rates will still be fairly strictly controlled due to the small number of financial enterprises participating in the competition (there are only three specialized banks, that, in the strictest sense, can join in competition). Therefore, competition of this sort will have a limited effect on improving economic effectiveness of banks.

An important measure in encouraging full non-interest-related competition among banks is the decentralization of specialized banks. Such banks in all cities would be divided up into several large, medium, and small banks, none of which would be controlled administratively as before. Each would become an economic entity characterized by a synthesis of operational rights and economic effectiveness, and would deal directly with enterprises and be professionally supervised by the People's Bank. At the same time, the further development of diversified financial enterprises and the selection of well run, well financed large-scale industrial and commercial enterprises to directly participate in financial activities would promote the integration of industrial and finance capital. A multilevel, multifunction financial system characterized by a division of labor and mutual coordination would be formed via banking decentralization and the development of diversified financial enterprises.

The autonomy of banks would be further expanded based on a foundation of banking decentralization. This should entail: allowing banks to open up new categories of deposit and credit, to issue bank notes and other bills, and to have the power to select customers for deposits and loans. In coordination with this, industrial and commercial enterprises could freely choose banks for deposit and the taking out of loans and could open accounts in more than one bank, so that banking decentralization and increased autonomy could lead to the same phenomenon among industrial and commercial enterprises. More power to set interest rates could be granted to the banks given a balance between overall supply and demand of public funds and the presence of only a small gap in social demand for capital. At the same time, more profit could be retained by banks, which should take firm steps to shift to the payment of taxes instead of profits to the state.

Until there have been greater changes in the state financial investment system, the People's Bank could establish under its direct leadership, specialized investment banks to take responsibility for and manage that portion of capital that would be freed for enterprise credit instead of being allocated to enterprises by the state. In this fashion, the various decentralized banks could engage in long-term business investment, while financial investment would be concentrated and managed by the specialized banks under the jurisdiction of the People's Bank, sharing responsibility with the Planning Commission for supervision of the direction and use of these investment funds.

The circulation of capital among regions could be opened up, so that industrial and commercial enterprises from all over could open accounts in Guangzhou and outside banks could set up branches here, while Guangzhou's various banks could be encouraged to open branches elsewhere, which would promote a horizontal flow of capital among regions and the formation of the financial center.

FINANCE AND BANKING

STRENGTHENED CENTRAL BANK MONEY-CONTROL FUNCTION URGED

Beijing JINGJI RIBAO in Chinese 8 Jan 86 p 3

[Article by Ding Bangshi [0002 6721 4258]: "Strengthen Central Bank's Control Over Basic Money Supply"]

[Text] Maintaining a balance between aggregate supply and demand for money is closely related to whether banks are able to control credit outlets. If credit outlets are kept under control then a basic balance between aggregate supply and demand for money can be maintained; otherwise control over credit issuance and the money supply will be lost. To prevent loss of control over credit, it is essential to raise the proportion of deposit reserved fund that specialized banks remit to the central bank and strengthen the central bank's control over the basic money supply.

After 1955 the People's Bank of China was a unified bank. In regard to domestic banking activities it was the center for "cash, credit, and account settlement"; it was the source of money supply, it handled deposits from state enterprises and departments and was the clearinghouse for payments between state-run units. It was thus fostering the circulation of money in the following ways: first, because bank deposits from the various enterprise units of a state-run department kept money circulating; second, because it handled the movement of cash for nonstate workers and collective units. Under this structure, the People's Bank bore a double burden of professional duties: First it was responsible for supervising the bank accounts of the various state-run enterprises so that the People's Bank could continue to supervise the overall finances of a unit and make sure that these enterprises were conducting their affairs according to the national plan; its second duty was to maintain control over the nation's money supply.

The bank's structure and functions have undergone several changes since 1979. The first step was to make the central bank the leader and make the various financial organizations that form the main body of specialized banks (including all other financial organizations) into savings institutions. Since 1980, the formerly separate management of savings and loans has come together under the "deficit control" system of specialized banks who are trying to deal with the deficit between credit and deposits. Consequently, specialized banks now have the capability to engender derivative deposits.

Deposits in specialized banks can be broken down into three categories. First, there are state finance deposits. These deposits are directly under the control of the central bank and are not a source of funds available to the specialized bank. Second, are ready-cash deposits; these include the savings deposits of urban and rural residents and the fixed-term deposits of enterprises. Third, there are circulating deposits. These mainly consist of demand deposits of enterprises and generate the major portion of derivative deposits. These funds that make up derivative deposits are originally loans extended to the specialized banks by the Central Bank; they are the money supply. Once this basic money supply is held by the specialized banks, it can then be extended to the enterprises in the form of loans; thus if money earmarked for enterprises increases, this will eventually result in enterprises increasing their deposits, which in turn will stimulate specialized banks to make a corresponding increase in credit. Thus it can be seen that the original source of money for specialized banks can result in manifold increases in deposits and in the money supply. The level of credit control is necessarily in the realm of rationally limiting the basic money supply.

The People's Bank of China is the supplier of money and the final source of loans. It determines the basic money supply for the national economy and is the original source of money for all specialized banks. To better regulate money, the People's Bank of China has established a system of deposit reserved fund. All specialized banks will deposit a portion of their funds into the central bank and the central bank will extend loan-style credit to the specialized banks (interests to be paid to depositors). More and more people are now recognizing that if a money-supply mechanism that is based on deposit reserved fund can be set up and perfected, not only will it be beneficial to the regulation of money, but it also serve as a means to control the multiplying rate of money supply, thus aiding in the management of aggregate finances. In more concrete terms, the reciprocal of the rate of deposit reserved fund multiplied by the ratio of enterprise deposits in the proportion of all bank deposits and cash (reserves) is equal to the entire amount of money. In the 6 years since 1979, the ratio of enterprise deposits to a bank's overall deposits and cash reserves averaged 27.99 percent. According to present regulations, 10 percent of all enterprise deposits in specialized banks must in turn be deposited in the central bank as precautionary funds. Thus the enterprise deposit rate is multiplied by 10 and the rate of money growth is $10 \times \frac{27.99}{100} = 2.8$. This rate is a bit high in relation to China's present circumstances. But if the rate of enterprise deposit funds to be assessed for deposit reserved fund were, respectively, 20 percent, 25 percent, and 30 percent, then the rate of money growth would fall to 1.4, 1.1 and 0.9, respectively. Suppose that during the term of a plan the central bank decides to supplement credit by 50 billion yuan. If at various times the ratio of enterprise deposits to be remitted for deposit reserved fund were 10, 20, 25, or 30 percent, then the volume of the money supply would increase during the term of the plan over the previous term, respectively: 50 billion yuan x 2.8 = 140 billion yuan; 50 billion yuan x 1.4 = 70 billion yuan; 50 billion x 1.1 = 55 billion; and 50 billion x 0.9 = 45 billion yuan. If each of these respective increases are added on to the actual money supply at the end of the previous plan term, then it may be possible in the course of the present plan for the overall money supply to reach the upper limit.

From the above calculations, we can see that the central bank's control over the proportion of funds to be remitted by specialized banks for deposit reserved fund can also lead to control over the tightness of losseness of credit issuance from specialized banks. When the ratio of deposit reserved fund is high, this can reduce or suppress the creation of money, which will in turn reduce the amount loans available from specialized banks and put a halt to loose credit. On the other hand, when the deposit reserved fund proportion is low, the money supply tends to multiply; loose credit may appear, as it did the year before last, creating the possibility that control over credit could be lost. Thus in order to strengthen its macroeconomic control, the Central Bank must first control the basic money supply and once again readjust the 10-percent proportion rate for deposit reserved fund. Right now this proportion should be fixed at 25 to 30 percent for enterprise demand deposits and 10 to 15 percent for urban and rural workers' savings accounts and enterprise time deposits; these are more suitable rates. These proportions are not to be considered immutable; the central bank can readjust them to correspond with circumstances regarding national economic development, the aggregate money supply, or the availability of credit. In order to control the overall money supply from a macroeconomic position, the central bank must not publish a precisely quantified plan regarding the scale of credit or the money supply; the money divided up and distributed to the various branches of the specialized banks will itself serve as a planning directive and an added control. The head office of the central bank will not pay interest to any specialized bank on the deposit reserved fund that it remits; those funds will be set aside for genuine emergency or special situations. Specialized banks may lend money between themselves at discounted rates as adjustments on surpluses or shortages, but these transactions must be cleared through accounts with the People's Bank so as to facilitate the central bank in its supervisory work.

MINERAL RESOURCES

GOLD MINING BY PRIVATE CITIZENS ENCOURAGED

Hong Kong CHING-CHI TAO-PAO [ECONOMIC REPORTER] in Chinese No 3, 13 Jan 86 p 28

[Article by Xu Xu [1776 2700]: "Surveying and Mining of Gold by Private Citizens Encouraged; Price of Gold Raised, Rewards for Striking Gold Set, Development Funds Provided"]

[Text] China has become a major gold-producing nation. China's yearly production of gold has catapulted it into sixth place among the gold producers worldwide after South Africa, the Soviet Union, the United States, Canada, and Australia.

Increasing production and reserves of gold is an important part of the Seventh 5-Year Plan which begins next year. This is so because it is both an important industrial raw material and a hard currency. The production of gold is closely involved with balancing the budget, balancing foreign exchange payments and guaranteeing the smooth implementation of the economic reforms.

Zhu Xun [2612 6064], who recently became head of the Ministry of Geology and Mineral Resources, not long ago at the National Gold Work Conference declared: It is essential that China greatly increase production of gold in the short run. In the next 5 years every effort must be made to surpass the total output of gold during the Sixth 5-Year Plan by 55 percent and guarantee that by 1990 yearly production will have doubled the present level.

Large-scale surveying for gold is now in progress throughout the interior. For this purpose the government has created a special National Gold Geological Survey Leadership Group to set up a coordinated, unified plan and lead China in its gold-mining program.

According to relevant data, at present mankind has in its possession some 90,000 tons of gold. There are still 60,000 tons unmined, most of which is in South Africa, the Soviet Union, the United States, and, further down the list, China.

China has 4 gold-mining territories and 58 mining areas, which, besides those in Shanghai Municipality, are scattered throughout various provinces, municipalities, and autonomous regions (including Taiwan Province). Of the various categories of potential gold deposits in the world, all have been discovered in mainland China. The era when China only mined gold from veined quartz or gold-laced sandbeds is now past.

Concerning China's gold deposits, experts say that the placer gold are mainly deposited in the No 4 style of river valley, which is to be found in Heilongjiang, Sichuan, Shaanxi, Gansu and Jilin. The major gold veins varieties--quartz type vein deposits, eroded rock deposits, and metamorphized molten gold deposits--are found in Shandong, Heilongjiang, Jilin, Henan, Hebei, and Hunan provinces. Gold in existence together with other kinds of mineral are found in Hubei, Anhui, Jiangxi, Gansu, and Liaoning. Other known varieties with good mining potential, such as Kalin gold, has also been widely discovered in China. Furthermore, western China is essentially virgin territory for gold mining. Areas considered ripe for mining gold, such as the Dalimu basis, the Zhungeer basin, the Ili River valley, and the Lhasa area have not even been thoroughly surveyed.

The history of gold mining in China is long, the earliest trace of it being in the Yin period of the Shang dynasty, about 3,000 years ago. During the reign of Guangxu in the late Qing dynasty, yearly production of gold was about 413,000 ounces which was a record at that time. But because of invasions and the spread of the civil war, production of gold suffered a severe setback in China; by the time new China was established in 1949, yearly production of gold had fallen to 200,000 ounces.

Since 1957, China has progressed with geological surveys for gold. In the mid-60's and especially since 1975 there have been successive discoveries of large-scale gold deposits, including those at Tuanjie Ravine and Mt Dongfang in Heilongjiang, Xincheng, Jiaojia, and Cangshang in Shandong and Hetai in Guangdong.

China has a corps of more than 52,000 working exclusively on gold and geologic surveys, including a geological team from the Ministry of Geology, a geological team from the Nonferrous Metal Corp. and the Wujing Gold Corps (formerly the Army Engineering and Gold Mining Corps). These surveyors already possess an array of advanced domestic and foreign mining and surveying equipment. Through the use of new methods for analyzing contents of gold, China has moved from its former utilization of geochemical gold samples in searching for gold to the application of direct prospecting for gold.

During the last 10 years, yearly production of gold in China on the average increased more than 10 percent. More than 100 core gold mines and more than 4,000 smelting locations have been established. Basically, most important gold mines are now using mechanical equipment for drilling, packing and transporting. Placer gold mines are equipped with mining vessels and advanced washing systems. Mines famous in China and overseas are in the Jiaodong peninsula and the Xiaoqin Mountains. In the past, China did not have a county that produced 10,000 ounces of gold but by 1984 there were 14 such counties. They are Zhaoyuan, Rushan, Huangxian, Yexian and Muping counties in Shandong; Kuancheng, Qinlong and Qianxi counties in Hebei province; Lingbao and Songxian counties in Henan Province; Harqin Banner and Qahar Right Wing Middle Banner in Nei Monggol; Beipiao in Liaoning Province and Mojiang in Yunnan Province. Among the above is Zhaoyuan County in Shandong, known as "the City of Gold," which last year led the nation in gold production with 80,000 ounces.

In order to expand gold production, the Chinese government has set forth a policy whose most important elements are as follows:

--State and collective eneterprises as well as individuals are encouraged to mine gold. Regardless of the industry, department, or area, all that is needed are the resources and manpower to get a mining operation underway.

--The price of gold will be raised. After undergoing several adjustments, the present price of gold per ounce is 700 yuan, a 460-yuan increase over the price in 1962. Moreover, for private goldminers the price may go as high as 900 yuan per ounce.

--Rewards for discovering gold have been established. For each mine discovered with 1 ton of gold reserves, the China Gold Corp. will offer a reward of 10,000 yuan or $5,000 in foreign exchange.

--Development funds will be supplied. For each ounce of gold remitted, in addition to paying for the gold, development funds worth 200 yuan will be offered as a bonus; local or state enterprises will receive an amount of foreign exchange proportionally correspondent to the volume of gold turned in. The state will also offer gold producers low-interest or interest-free loans and material subsidies as well priority shipping and electricity.

Gold mines in China are predominantly on a medium or small scale; large mines are few. Thus, the government has instituted the policy that "Big mines must be extensively developed and small mines must be given free rein." Furthermore, since the long-term ban on private citizens mining gold has been lifted, the nation has been in the throes of "Gold Fever." Based on incomplete statistics, among the more than 2,000 counties in China, more than 400 counties and 200,000 people are engaged in gold-mining operations. Last year, local and private medium- and small-scale mining operations accounted for nearly half of the nation's total gold production.

In the last year or two several large-scale private gold mines have appeared, such as the Shuanglong gully in the Ha River region of Tianzhu County in Gansu Province. In the 10-li-long river valley, there are more than 330 gold-mining shafts and more than 17,000 workers, not including the 2,000 plus people sifting sand for gold along the river bed. According to estimates from that area's administrative body, from July of the year before last until last July, the Shuangdong gully produced all together more than 1,000 jin of gold, a daily average of 30 ounces. In this kind of private gold-mining operation the big problem is that a substantial amount of gold flows into the hands of private merchants. Relevant departments will soon propose a new scheme to strengthen administration of gold mining by private citizens.

INDUSTRY

RAPID INCREASE MADE IN CHEMICAL FIBER PRODUCTION

Tianjin TIANJIN RIBAO in Chinese 21 Nov 85 p 1

[Article by Li Anding [2621 1344 1353]: "China's Chemical Fiber Production Jumps to Sixth Place in the World"]

[Text] Reporters learned the following from the international conference on manmade fibers that recently opened in Beijing: China's young manmade fiber industry experienced rapid growth during the Sixth 5-Year Plan; it now has an annual production capacity of 1 million tons and has leaped to sixth place in the world. China's production of various manmade fibers during the first 10 months of the year totaled 760,000 tons and the total for the year is expected to exceed 800,000 tons, which is roughly an 80-percent increase over 1980.

A group of manmade fiber experts from various countries regard the very fast growth of China's manmade fiber production, that went from an annual production of 100,000 tons in the early 1960's to the present 800,000 tons to be a rare occurrence in the world's history of manmade fiber development. Manmade fiber now accounts for 22 percent of China's total textile industry and has become the material second only to cotton.

China's manmade fiber industry is going from the stage where it mainly produces viscose fibers into a stage concentrating on synthetic fibers, giving the needed attention to raw materials and producing fiber-spinning equipment. Widely used polyester fiber already accounts for over 60 percent of production. Some new varieties being developed internationally are already being volume produced in China. For example, the annual production of dope dyeing fiber is approximately 20,000 tons, while heterogeneous varieties, fluffy and soft air-jet polyester fiber and composite fibers that have the natural crimping effect of wool are being produced in small volume. Porous, water-absorbing polyester that offers good ventilation and the texture of silk, and carbon fiber that has good rigidity and can withstand high temperature have also been successfully developed in China.

CHINA'S SHIPBUILDING INDUSTRY SHOWS CONTINUED GROWTH

Shanghai WEN HUI BAO in Chinese 5 Dec 85 p 1

[Article by Xin Guangqi [6580 0342 3825] and Xu Minzi [1776 2404 1311]: "China's Shipbuilding Industry Marches Toward the World, Export Ships for the Last 5 Years Have Totaled 1.25 Million Tons, With the United States, Italy, and Various Other Countries Placing Orders for These Ships; Products Used in Shipping Have Been Exported to Dozens of Countries and Regions"]

[Text] While international shipbuilding is in a slump, China's shipbuilding industry is steadily developing. There are now over 800 ship plate plants and other specialized equipment plants throughout China, and during the last 5 years these yards and factories have built export ships totaling 1.25 million tons. China's developing shipbuilding industry has drawn widespread interest from international shipbuilding and shipping circles. This information was learned by reporters at the 1985 International Maritime Technology Academic Conference and Exhibit which opened yesterday.

China now has over 530 ship plate plants and over 330 specialized marine equipment plants that employ 540,000 people. Most of the scientific research, design, and production capability of these facilities are under the China State Shipbuilding Corp [CSSC]. This corporation has under it regional companies at Shanghai, Guangzhou, Dalian, and nine other places, it has also set up the China Shipbuilding Trading Corp., the China Offshore Platform Engineering Corp., the China Hovercraft Technology Development Corp., and six other specialized corporations. These posses a total of 26 shipyards, 14 building berths capable of building ships larger than 10,000 tons, the largest being a 100,000-ton class berth; they have 15 docks of the 10,000-ton class with the largest being a 50,000-ton dock. The CSSC also manages Asia's largest ship testing and research organization.

Of the regional corporations, the Shanghai Shipbuilding Corp's 9 shipyards, that include Jiangnan and Hudong, have built ships that account for nearly 50 percent of the entire country's tonnage output, and during the Sixth 5-Year Plan have built 54 ships exceeding 10,000 tons. State Gold Awards for quality have been awarded to four of these ships and silver awards have been given to nine other ships and engines.

Currently, China is capable of designing and building its own submarines, destroyers, and various other types of warships and auxiliary vessels for military use; China has developed specialized ships such as the "Xiang Yang Hong No 10" and the "Yuan Wang" multipurpose hydrographical ships, ships for offshore exploration and salvage ships; China has built over 500 various types of ships and boats for ocean, coastal, and river use including freighters, tankers, large dredgers, powerful tugboats, hovercraft, and water-jet-propelled craft; and China has also built many semisubmersible and jackup drilling rigs.

Since 1980, China has been developing its ship export business. The shipyards concerned have engaged in active economic and technical exchanges and cooperation with other countries, over 200 contracts have been signed dealing with technical cooperation and trade licenses with the main purpose of importing advanced technology. This has greatly accelerated the modernization of China's shipbuilding industry. China's ship exports total 1.2 million tons, with the United States, Italy, the FRG, and Norway among the countries placing orders. Scores of marine products including diesel engines, diesel generating sets, propellers, and magnetic compasses are now being exported to dozens of countries and regions. The majority of products produced using imports technology have now been approved by China's marine inspection organizations and related organizations of foreign countries.

PRODUCTION TRANSFORMATION OF NO 1 AUTO PLANT

Changchun JILIN RIBAO in Chinese 6 Jan 86 p 1

[Article by Li Shizheng [2621 1102 2398]: "Production Increase Realized by No 1 Auto Plant During Remodeling Transformation, Automobile Production for 1985 Totaled 85,000 Vehicles, Comparison of the Sixth 5-Year Plan with the Fifth 5-Year Plan Shows a Production Increase of 23 Percent and a Profit Increase of 30 Percent"]

[Text] The economic index of the Changchun No 1 Auto Plant showed a large increase during the Sixth 5-Year Plan. In comparison with the Fifth 5-Year Plan it showed an increased production of 23 percent, increased output value of 33.5 percent and profit of 30 percent.

During the Sixth 5-Year Plan, the remodeling transformation of the No 1 Auto Plant was placed on the list of key state projects. Remodeling transformation involves a large amount of work and some very arduous tasks. Along with this transformation work an increase in production also had to be maintained, which caused great difficulties. In order to shoulder both of these heavy burdens, personnel of the No 1 Auto Plant boldly searched for new methods and under overall planning carried out work in a synchronized and staggered manner. They persisted in reform and while strengthening political and ideological work also implemented decentralized management and various forms of the economic contract responsibility system which greatly aroused the enthusiasm of the workers. Under the condition of having excess work loads on various production lines and key facilities, they used conscientious organization and meticulous planning to enable the plant to have yearly production increases. The plant's automobile production for 1985 totaled 85,000 vehicles and had its best economic results ever that year.

At the same time production was being increased, the majority of remodeling transformation work was also completed. Design has been finalized for remodeling of the new car, the engine has undergone production line trial-assembly, trial-installation and test-production has been carried out on other items, and the best use is being made of imported items.

INDUSTRY

PLANS OUTLINED FOR NONFERROUS METALS INDUSTRY

Hong Kong LIAOWANG OVERSEAS EDITION in Chinese No 12, 24 Mar 86 p 20

[Article by Yang Like [2799 4409 4430] and He Wenping [0149 2429 0756]: "The Current Situation and Prospects of China's Nonferrous Metals Industry"]

[Text]

I

China has extremely abundant nonferrous metals resources. The range in kinds is complete and the reserves are sizable. China has the world's largest reserves of tungsten, tin, antimony, zinc, and rare-earth metals. Its reserves of copper, aluminum, lead, nickel, molybdenum, and other metals are among the first rank in the world. Looking at proven deposits today, China has every nonferrous metal element on the periodic table, This is an exceptional advantage for the expansion of the nonferrous metals industry.

What is the present level of development of China's nonferrous metals industry, and what is its place in the national economy? The other day, Fei Ziwen [6316 1311 2429], general manager of China Nonferrous Metals Industry Corp. explained to reporters: the nonferrous metals industry is an industry that requires little capital yet produces much. The ratio of investment to returned income is 1: 1.6. That is to say, yuan of state investment produces 1.6 yuan in income. This is the fourth highest such return among heavy industries, surpassed only by petroleum, petrochemical, and machine industries. The nonferrous metals industry also is a good producer of foreign exchange. Since 1949, the foreign exchange earned from the export of refined tungsten has been the leader of all of China's exported products.

The nonferrous metals industry is a basic industry. It also is the basis for other basic industries. It is an important component of high-quality materials. Today, with the constant change in science and technology and with the rapid advance of the industrial revolution, the expansion of the nonferrous metals industry is even more important than ever. The party's central leadership has instructed that the nonferrous metals industry be placed in important positions in the Seventh 5-Year Plan and in future 5-year plans after today. This is a policy with strategic vision.

II

Fei Ziwen said China was one of the first civilized countries to discover and use nonferrous metals, but the nonferrous metals industry did not really start until after 1949. From 1953, when the Fushun Aluminum Plant produce China's first aluminum ingot, until today, the nonferrous metals industry has fully developed. Annual production has increased 100-fold over that in the early years of the People's Republic. Moreover, quality has greatly improved and the number of varieties expanded. According to 1984 statistics, there are 800 enterprises, employing 1.2 million staff and workers in the nonferrous metals industry system. A large-scale, independent system for the nonferrous metals industry has been built, from geological exploration, planning and construction, to production research and schools.

The development of China's nonferrous metals industry has gone through three periods: first steps, stagnation, and expansion. The 17 years before the Cultural Revolution comprise the first period. During this period, there was rapid expansion in terms of quantity, quality, and variety. Foreign exchange earned from exports exceeded the amount of foreign exchange spent on imports. During the 10 years of disruption, the development of the nonferrous metals industry was slow, and even declined for a time. Exports decreased and imports increased. Departments that had earned foreign exchange became departments that spent foreign exchange. After a period of gradual recovery, quickened development began after 1983. The total value of production in the nonferrous metals industry has progressively increased, as have both profits and the amount of foreign exchange earned.

Even though the nonferrous metals industry has developed to a certain extent, it still cannot meet the needs of the national economy. Production remains a relatively weak link. Quantity, quality, and variety all await improvement. Moreover, the situation of imports exceeding exports has yet to be reversed.

III

In order to improve leadership in the nonferrous metals industry and to further utilize China's nonferrous metals resources, the State Council decided to remove the nonferrous metals industry from the Ministry of Metallurgical Industry. On April 1, 1983, the China Nonferrous Metals Industry Corp. was founded. It reports directly to the State Council. It combines both production and sales, industry and trade. It shoulders economic responsibilities for the state, but also has the status of a legal person. The corporation is guided by the central state plan and exercises centralized management of production, distribution, and sales, of personnel, finances, and materials, and of domestic and foreign trade in all subordinate enterprises. In addition, it has the responsibility for overall planning for production, construction, and imports and exports related to China's nonferrous metals industry. For more than 2 years, the party's central leaders have listened on a number of occassions to reports from the corporation and have given important instructions: The nonferrous metals industry is one of China's most important industries. Within it are abundant resources. It is a department that can be very profitable. With the push of time, it will become increasingly profitable. We should have this vision.

Fei Ziwen said the State Economic Commission, the State Planning Commission, and other departments have worked with the corporation in setting the Seventh 5-Year Plan for the nonferrous metals industry. Using 1983 production as the base, the Seventh 5-Year Plan calls for doubling production of 10 nonferrous metals. We should carry through reforms, and continue to implement the strategic plan for the development of nonferrous metals. Top priority will be development of aluminum, with active development of lead and zinc, and where conditions permit, of copper. There will be selective development of tin, antimony, and other products that are good exports. The Seventh 5-Year Plan emphasizes the improvement of technology, and the expansion of existing enterprises and production bases. There are 26 key projects involving new construction in critical production areas and in large and medium-scale capital construction projects. For aluminum, the emphasis will be on expanding aluminum industries in the northwest and southwest regions ans in Henan. For lead and zinc, the emphasis will be on construction in the northwest region. For copper, key factories and mines in the lower Chang Jiang region will be expanded. For tin, the two tin base areas of Yunnan and Guangxi will be improved and expanded, with support given to the expansion of some medium-and small-scale tin mines. For nickel, there will be continued construction in the second phase of the Jinchuan project.

The general manager also told reporters: "During the Seventh 5-Year Plan, emphasis will be placed on scientific research and much effort will be devoted to finding new nonferrous metal materials. The development of new materials in coordination with military-industrial production, such as aluminum-gold and titanium-gold compounds and other special nonferrous metals, will serve in sharpening technology and modernizing national defense. The development of new electronic materials will be actively pursued in order to meet the research and production needs of large-scale integrated circuits. A key research project will be exploration for the special materials used in large-scale nuclear power plants, so that all of the zirconium-gold compounds used in China's nuclear power plants will be completely supplied domestically, and superconductive materials will enter the international marketplace. There are also plans for the extension of rare-earth compounds and new materials with large social returns, and other items.

Fei Ziwen, who has just turned 50, is an expert who has worked in the nonferrous metals industry over 30 years. He studied at one time in the Soviet Union, and worked for many years doing basic-level work. In 1983, he was appointed general manager of China Nonferrous Metals Industry Corp. He said that since 1983 the corporation has signed agreements with 23 provinces, municipalities, and autonomous regions for joint operation of 39 projects. This has changed the old situation of single-enterprise management and having no other choices. It has mobilized resources on all fronts, and offers advice and support for the expansion of the nonferrous metals industry. At the same time, the corporation will actively use foreign capital. It already has professional relationships with 300 companies and factories from 22 countries and regions to import advanced foregin technology and equipment and to jointly invest with foreign enterprises in mines and factories.

SMALL-SCALE ENTERPRISES

NI XIANCE, OTHERS ATTEND JIANGXI RURAL ENTERPRISE MEETING

OW281245 Nanchang Jiangxi Provincial Service in Mandarin 1000 GMT 27 May 86

[Excerpts] Speaking on behalf of the Jiangxi Provincial CPC Committee and the provincial People's Government, Jiang Zhuping, member of the standing committee of the provincial CPC committee and vice governor of Jiangxi Province, put forward some new demands for Jiangxi's village and town enterprises at a provincial meeting on village and town enterprise work. He called on village and town enterprises to continue the trend of development, achieve a growth rate higher than the nation's average, higher than Jiangxi's industrial growth rate, and no lower than their last year's growth rate, and strive for new great developments this year. The meeting opened in Nanchang on 24 May.

Some 320 persons attended the meeting. They included the comrades in charge of rural work and directors of the bureaus of village and town enterprises of prefectures, cities, and counties and representatives of some provincial departments concerned.

Provincial party and government leaders Ni Xiance, Xu Qin, Jiang Zhuping, Pei Dean, Zhao Zengyi, Peng Shengxi, and (Li Liang) attended the meeting. Ni Xiance, Xu Qin, and Zhao Zengyi also spoke at the meeting.

Ni Xiance said: It conforms with Jiangxi's realities for our village and town enterprises to continue to strive for great developments. Our village and town enterprises made tremendous achievements last year. However, we are still way behind our neighboring provinces in this respect. The per-capita income of our peasants is low and our revenues are small. This fact has something to do with the slow development of our village and town enterprises. The development of village and town enterprises is a key to our economic development and to achieving a growth rate slightly higher than others. After laying down a policy for development, we should also clarify our guiding principle. Our guiding principle should be one of enhancing understanding, putting the village and town enterprise on the right track, adopting more flexible policies, and providing positive support.

Jiang Zhuping delivered a report at the meeting. His report was entitled: Persist in Thoroughgoing Reforms, Continue Decontrols and Economic Invigoration, and Bring About a Greater Development in Jiangxi's Village and Town Enterprises. The meeting closed on 27 May.

ANHUI GOVERNOR PRESENTS SEVENTH 5-YEAR PLAN REPORT

OW021101 Hefei ANHUI RIBAO in Chinese 30 Apr 86 p 1

[Report by Anhui Governor Wang Yuzhao: "Hold on to Reform, Unroll Another Great Project, and Strive To Achieve Anhui's Seventh 5-Year Plan"--Delivered at the Fourth Session of the Sixth Anhui People's Congress on 21 April 1986; passages within slantlines published in boldface]

[Text] Deputies:

The just-concluded Fourth Session of the Sixth NPC is of great historical significance. The series of documents adopted at the meeting, including Premier Zhao Ziyang's "Report on the Seventh 5-Year Plan," are important documents that guide China's socialist modernization drive. We firmly support their guidance and will earnestly adhere to it according to Anhui's actual situation. On behalf of the provincial people's government, I should now like to report to you about the work of the provincial government and Anhui's Seventh 5-Year Plan.

I. A Review of the Work of the Past 5 Years

Thanks to implementing the series of principles and policies set forth by the party Central Committee and the State Council, giving top priority to reform, and constantly accelerating the pace of enlivening the local economy and opening to the outside world during the last 5 years, we have consolidated and developed political unity and stability, achieved sustained, steady, and coordinated economic growth, and basically accomplished the mission of achieving a fundamental improvement in our financial and economic situation, thus creating the most dynamic economic growth in Anhui since the republic's founding.

/The economy has been growing fairly rapidly./ In 1985, Anhui's gross social output was 58,107 million yuan, an increase of 92.9 percent over 1980, or an annual growth of 14 percent; the total industrial and agricultural output was 40.58 billion yuan, an increase of 87.5 percent over 1980, or an annual growth of 13.4 percent, overfulfilling the target prescribed in the Sixth 5-Year Plan by 29.2 percent; the people's income was 27,391 million yuan, an increase of 76.8 percent over 1980, or an annual increase of 12.1 percent; the revenue was 3,016 million yuan, an increase of 48.6 percent over 1980, or an annual growth of 8.2 percent; and the total of consumer goods retailed reached 14.38 billion yuan, an increase of 90.8 percent over 1980, or an annual growth of 13.8 percent. All major products registered significant increases in 1985. Among them, grain output reached 21,679, 600 metric tons, or an annual increase of 8.3 percent; steel output was 1,943,000 metric tons, or an annual increase of 7.4 percent; coal output was 29.05 million metric tons, or an annual increase of 3.8 percent; and electricity output was 13.49 billion kWh, or an annual increase of 7 percent. In short, all the major targets set in the Sixth 5-Year Plan were overfulfilled.

/A new breakthrough was achieved in revenue./ During the Sixth 5-Year Plan, Anhui's total revenue was 11,956 million yuan, an increase of 1,935 million yuan, or 19.3 percent, over that of the Fifth 5-Year Plan. A new breakthrough was achieved during the last 2 years. The new increase of 200 million yuan in 1984 ended the stagnation of the previous several years; an even greater success was achieved in 1985. The net increase of 580 million yuan in that year was a record high.

/The proportion of development between major sectors became more coordinated./ Gross agricultural output in 1985 was 15.14 billion yuan (not including the village industry output). Its proportion of the total gross industrial and agricultural output dropped to 37.3 percent in 1985 from 41.1 in 1980; gross industrial output in 1985 was 25.45 billion yuan (including village industry), and the proportion of the gross industrial and agricultural output rose to 62.7 in 1985 from 58.9 percent in 1980. In the agricultural sector, the proportion of output of forestry, animal husbandry, sideline production and fishery rose from 27.5 percent in 1980 to 38.1 percent in 1985. In the industrial sector, the proportion between light industry and heavy industry became increasingly rational. New headway was made in the development of tertiary industry.

/The material and technological foundation was reinforced./ During the 1980-85 period, Anhui invested 12,667 million yuan in fixed assets, or an increase of 73.5 percent over that during the previous 5-year period. Of this investment, 88.63 billion yuan was spent on capital construction projects, or an increase of 40.7 percent. During the 5-year period, 21 large and medium-size projects were completed or partially completed. The generating capacity of the Huaibei and Luohe power plants was expanded by 700,000 kilowatts. The operation of the five coal shafts--Liuqiao No 1, Qianling, Zhuxianzhuang, Panji No 1, and Linhuan--expanded coal mining capacity by 6.9 million metric tons. Construction of the Ningguo cement plant was basically completed. The Baimashan cement plant was commissioned for production. The new Cihuai waterway began to yield results. Successful results were achieved in the construction of eight commercial food grain bases. During the 1980-85 period, Anhui spent 3,807 million yuan on reconstruction projects. That was 3.8 times higher than the amount spent during the preceding 5-year period, and because of the completion of over 3,500 projects, economic growth had even greater potential.

/Science, technology, education, and other social undertakings showed vigorous development./ During the Sixth 5-Year Plan, the province spent 2.37 billion yuan for operating expenses for science, technology, and education projects.

This was 75.3 percent more than such expenses during the Fifth 5-Year Plan and accounted for 22.7 percent of the total financial expenditure compared to 15.9 percent for the preceding period. During these 5 years, fruitful results were achieved in 1,800 major projects of science and technology, or 1.5 times as many as the projects completed during the Fifth 5-Year Plan. More than 200 projects received awards from the state, ministries, or province. Regarding the development of education, the target set in the Sixth 5-Year Plan was overfulfilled. During these 5 years, 71,600 new students were admitted to institutions of higher learning for regular and specialized studies, and some 37,900 students graduated from universities, specialized colleges, and graduate schools and went to work on various fronts. This period also witnessed 16 new institutions of higher learning and 122 new urgently needed specialized courses established in the province. At the same time, various types of adult education developed vigorously, and intensive progress was made in restructuring secondary education. Among school-age children, the percentage of those actually attending schools rose from 88.9 percent in 1980 to 94 percent in 1985. Remarkable achievements were also scored in the work of culture, public health, athletics, broadcasting, television, journalism, publications, civil affairs, foreign affairs, tourism, nationalities affairs, religious affairs, family planning, the people's air defense work, labor and employment, and environmental protection.

/The people's living standards continue to improve./ In 1985 the peasants' per capita net income in the province averaged 369 yuan, double the 1980 figure. The annual growth rate for this period was 15 percent. Food and clothing problems were resolved in most localities, while a transition to a comparatively well-off standard of living started in certain localities. During these 5 years, some 159 million yuan were made available for helping the poor, and work was done to provide assistance to 499,800 poor and difficulty-ridden households. As a result, 173,200 households were helped out of poverty; among them over 16,500 became specialized or well-to-do households. In 1985, the total amount of wages for staff members and workers of units owned by the whole people showed a 64.2 percent increase over 1980, and the average annual wage of an individual reached 1,044 yuan, an increase of 41.3 percent. With their better income, the consumption level of urban and rural residents continued to rise. During these 5 years, housing with a total floor space of 12.2 million square meters was build for staff members and workers, and the average housing space for each urban resident increased by 1.2 square meters. During the Sixth 5-Year Plan, 700,000 jobless youth were provided employment, and the unemployment rate of youth in cities and towns dropped to about 2 percent. By the end of 1985, savings deposits of urban and rural residents amounted to 3,843 million yuan, up 3.4 times compared with 1980.

During the Sixth 5-Year Plan, our province's economy improved year after year. In particular, the achievements were remarkable in 1985. In that year, the total product of society rose by 20.3 percent compared with 1984. Of this, the total output value of industry increased 20.8 percent, that of agriculture 18 percent, the volume of retail sales of commodities 20.3 percent, the total amount of imports and exports 47.7 percent, and financial revenue 23.7 percent. Under the state's unified planning, the task of achieving initial success in reforming the economic structure was completed for the most part.

The achievements that our province has made in economic construction are attributable to the implementation of the line, principles, and policies formulated since the 3d Plenary Session of the 11th CPC Central Committee and to the joint efforts made by the broad masses of workers, peasants, intellectuals, cadres, PLA commanders and fighters, public security cadres and police, and people of all strata in the province. Of the experiences gained during the Sixth 5-Year Plan, many are worth summing up. The following are important ones:

1. /Make unremitting efforts to grasp reform in order to develop social productive forces/

Since the 3d Plenary Session of the 11th CPC Central Committee, we have, starting from agricultural reform, promoted the output-related system of contracted responsibility on household basis, developed various forms of the cooperative economy, readjusted the production structure in rural areas in a timely way, reformed the system of unified and assigned purchase of farm products, and have thereby speeded up commodity development in rural areas. On the basis of rural reform, we have conscientiously carried out "The Decision of the CPC Central Committee on Reform of the Economic Structure" and embarked on an extensive reform of the economic system centering on urban reform. In addition, we have simplified the administrative structure and delegated more power to lower levels; worked to invigorate enterprises; taken steps to reform the planning, financial, and circulation systems; and straightened out the international relations of enterprises and their economic relations with other units. Price reform has been smoothly carried out, and we have made an important step forward in reforming the wage system. We have also taken extensive measures to reform the county-level economic system, which has whipped up the enthusiasm, enhanced the sense of responsibility, and unleashed the creativity of various economic sectors. In addition, we have moved to restructure the educational and scientific and technological research systems, and are deepening our efforts in the field. Currently, our reform is being made to cover wider areas, and the reform drive in all fields is being combined into a unified force which is giving impetus to the development of Anhui's economy and other undertakings. Reform has brought profound changes to the economic life of Anhui's people. We have paid greater attention to improving economic results instead of devoting all our efforts to increasing output value, have tried to use economic means and law on administrative and management work instead of totally relying on using administrative power, and our economic system has evolved from a closed type into an open type. In short, we have expanded our reform into a wider area and have made good progress in this field.

2. /Make unremitting efforts to grasp agriculture and enliven the rural economy/

Those who work in agriculture in Anhui account for over 80 percent of the province's total population. Output value of agriculture-based industry accounts for some 80 percent of the total light industrial output value, and agricultural products and processed agricultural products account for more than 85 percent of the province's total exports. Based on these facts, we laid special stress on agricultural development at a time when the rural economy was in a difficult situation and agriculture became a stumbling block of economic development, and we kept ourselves sober-minded and did not relax our efforts in agricultural development even when we enjoyed a boom in commodity development in rural areas. We attached importance to agricutlural development when we were short of grain and industrial raw materials. We also regarded agricultural development as a strategically important job and attached much importance to it even at a time when grain and other agricultural and sideline products were relatively abundant, and when we began to readjust the rural production structure. In guiding commodity production in rural areas, we did not totally depend on giving orders. Instead, we showed respect for the wish of the masses and regularly studied new developments in this field in order to solve new problems that may arise. By doing so, we have managed to prevent our rural economy from drastic changes. Facts in the last few years have shown that our attention to agricultural industry has stabilized our agricultural development, which has played a key role in prospering and stabilizing the entire economy of Anhui Province.

3. /Make unremitting efforts to invigorate enterprises and strive for technological progress/

In aiming at invigorating enterprises, raising their technological level, and improving their economic results, we have delegated more powers to enterprises and promoted the factory manager responsibility system and various forms of other responsibility systems. In addition, we have allowed establishment of small industrial and commercial enterprises and offered them incentives. As of now, 167 provincial-level enterprises have been handed over to lower authorities, and 70 percent of small commercial enterprises have been reorganized, leased out, transferred to collectives, or have switched to other trades. After simplifying the administrative structure and delegating power to lower levels, administrative departments at various levels have provided a better serivce to enterprises in an effort to create a better production and business environment for them. In invigorating enterprises, we have done away with the old idea of establishing new facilities for every production project. Instead, we paid more attention to improving existing enterprises' facilities and offered them preferential treatment in granting loans and levying taxes. By doing so, we may expect that reform will yield better results. We have also tried to better utilize and promote the use of imported technologies in order to improve the results of technological transformation. The 1985 overall productivity of public industrial enterprises operating on independent accounting systems increased by 33 percent over 1980, and taxes and profits generated from every 100 yuan of capital increased by 3.82 percent.

4. /Make unremitting efforts to develop village and town enterprises and step up the construction of small cities and towns/

Having undergone a process of exploration on the matter of village and town enterprise development, we eventually proceeded from Anhui's actual conditions by seriously summing up the fine experiences created by the public, establishing the guiding ideology of making thousands of households the fountainhead for developing the forces of village and town enterprises, vigorously developing household and joint household-run enterprises, and initially finding a new way to develop village and town enterprises in economically backward areas.

The total output value of village and town enterprises in 1984 was twice that of 1983, and there was an 81 percent increase over 1984 output in 1985. The village and town enterprises' great strides have become the mainstay of Anhui's rural economy. In developing a specialized, commodity, and modernized rural economy, the function of small cities and towns as rural commodity production bases has become increasingly evident. Tailoring our guidance to prevailing circumstances, we focused on speeding up the construction of small cities and towns as a means of enlivening the rural economy; convened a provincial meeting on the work of small cities and towns; drew up a series of policies aimed at encouraging peasants to provide for their own grain rations by working, doing business, and running service trades in town; and a number of farm and trade fairs, thereby creating fine conditions for the development of small cities and towns.

5. /Make unremitting efforts to boost income and promote a turn for the better in the financial situation/

In financial work, we paid attention to the proper handling of three relations. The first relation is between taking and giving, that is, taking as well as giving, with giving preceding taking, and "raising a hen to lay eggs." In order to prop up economic development as the county level, Anhui has appropriated 20 million yuan in each of the past 2 years for helping with the development of production in 21 counties on a successive and priority basis, and for building up financial resources. We also relegated power and surrendered profits to, and provided policies for 22 counties experimenting with comprehensive structural reforms in the past year, thereby increasing financial income at the county level and lessening Anhui's financial burden.

The second relation is between exclusive financial management and common financial management. In the past, under the unified arrangement for financial income and outlay, a provincial department was in charge of collecting financial receipts while the rest were financially dependent on that department, resulting in financial difficulty. During the Sixth 5-Year Plan, we started from structural reforms by implementing the financial contract system, encouraging the practice of "eating separately," and arousing enthusiasm at all levels for managing their own financial affairs.

The third relation is between tapping and retrenching financial resources. While vigorously boosting income, we also promoted careful budgeting and frugality, converted a portion of free allocations into loans, and urged departments using the funds to improve results in utilizing money.

6. /Make unremitting efforts to open to the outside world and vigorously develop lateral economic ties/

A shortage and funds and a low technological level have always been the restraining factors in Anhui's economic development. By opening to the outside world and enlivening the domestic economy, we forged extensive economic ties at home and abroad and opened up the path for accumulating funds and upgrading the technological level. During the Sixth 5-Year Plan, Anhui successively forged friendly ties with two foreign states and established a friendly economic and trade partnership with three other states. Four cities cemented friendly city ties with four foreign counterparts. In addition, economic, trade, and technological exchanges were developed with over 90 countries and regions. Foreign funds totaling $187 million were used, 492 technological deals were introduced, and $258 million worth of foreign exchange was utilized. The total export volume was $307 million in 1985. Anhui has now forged various forms of economic and technological cooperative ties with 23 provinces, municipalities, and autonomous regions in China. Since 1982, we have attracted one billion yuan or so of funds and developed over 2,100 cooperative projects. The scope of economic and technological cooperation has become increasingly extensive, moving gradually from cooperation in supplying materials and funds to technological cooperation and personnel exchanges; from simple association to multiple and multilayer association; from stressing the links with economically developed coastal regions to cementing ties with all places in China, including northern, northeastern, and northwestern China; and from stressing cooperation in production to establishing cooperation in circulation. Consequently, the whole economy was transformed from a closed type to an open type.

7. /Make unremitting efforts to promote circulation and develop the socialist commodity economy/

Circulation has long been a weak link. Under the influence of traditional ideas of natural economy [zi ran jing ji 5261 3544 4842 3444], and products economy [chan pin jing ji 3834 0756 4842 3444], the market was artificially cut apart and circulation was restricted, thus isolating us from the outside world. In recent years, we have come to realize that a fully developed commodity economy is the only way which leads to the development of society's economy and a prerequisite for modernizing China's economy. Cadres at all levels have raised their consciousness in developing the commodity economy, changed their habitual practice of stressing production but neglecting circulation, broken free from isolation, opened the door wide, striven to dredge and readjust the circulation channels, and established a "three many's and one few" [san do yi shao 0005 1122 0001 1421] circulation system. By putting more commodities on the market, speeding up circulation, and invigorating the market, the gap between supply and demand has narrowed, the impact of circulation on production has been magnified, and the entire economy has been invigorated. At the same time the circulation system is reformed and the socialist commodity market developed, the capital, technological, talent, information, and material resources market is also developing in a planned way, and a market system has been gradually established. The sustained agricultural and industrial development and increases in financial revenue in recent years are all directly related to the increasingly important role of circulation.

8. /Make unremitting efforts to promote spiritual civilization construction, bring about a fundamental change for the better in social practices/

While carrying out reform, we have always upheld the four basic principles, continuously pioneered in new methods for doing ideological and political work in the new period, promoted education in the current situation and policy with a definite goal, unfolded the "five stresses, four beauties, and three loves" activities, and encouraged new socialist morality and practices. In the rural areas, we have used the "cultural centers" as hubs to sponsor colorful mass literary and recreation activities and propagate advanced local deeds and personages, thereby conducting education in the course of recreation. In the cities, we start with building civilized cities as a beginning with a view to building civilized units by the various professions and trades. At the same time, by widely promoting propaganda and education in the legal system, striking at criminal and economic criminal activities, strengthening public security with comprehensive planning, ad concentrating our efforts on major cases, we have brought about changes for the better in both social practices and public order.

Over the past 5 years, we still have had certain shortcomings, made mistakes, and encouraged many problems and difficulties in our work.

In the area of reform, the main problem is the lack of coordination and overall planning. Besides, the achievements in reform are also somewhat lopsided. Some local departments have been sluggish in actions and reluctant to delegate power to the enterprises. There are still many problems and resistance in opening up the small state-run industrial and commercial enterprises to the public. During the transition from the old to the new system, we have failed both in ideology and in promptly adopting new methods in dealing with the continuously emerging new situations and problems. Our measures for macrocontrol are imperfect. The economic overheating at the end of 1984 also has had an adverse impact on our province. This was particularly reflected in the blind expnasion of capital construction projects, which resulted in tension in the province's economic life.

In the area of economic construction, the gap between total social demand and supply is still wide. The supply of capital, energy, and raw and processed materials has been insufficient. Financial expenditures have grown at a pace that is too fast. Subsidies have increased. The quality of some enterprises are poor, their technology and equipment backward, management level low, ability to assimilate weak, quality of products poor, consumption high, and their economic results poor. The ability of agriculture to resist natural disasters is still relatively weak. Some localities have tended to neglect grain production and have blindly grown industrial crops. The people's livelihood in some mountain areas, old revolutionary bases, and areas hit by natural disasters is still relatively difficult. Some localities have overburdened the masses and enterprises with unauthorized price increases, aportioning of funds, or levying of fees. At one time, the prices of vegetables and nonstaple foodstuff in some cities went up by too big a margin, and residents there were very angry.

In building spiritual civilization, ideological and political work is still our weak link. In some departments and units, the unhealthy practice of issuing unauthorized bonuses, material objects, and subsidies has not been entirely stamped out. In many leading organs, the problem of bureaucracy, shifting responsibilities to others, and wrangling is still serious. They vie with one another to replace sedans, indiscriminately send personnel abroad, and squander public funds on tourist trips. Their cadres engage in business for profit and indulge in extravagances and waste. Some of them even take graft, accept bribes, and abuse their power for personal gains.

All this has seriously affected the smooth progress of our reform and economic construction and should merit our serious attention. We must take effective measures to solve this problem.

II. /The Basic Tasks and Goals of Struggle During the "Seventh 5-Year Plan"/

Comrade Hu Yaobang recently said: In the next 5 years, we must do still better than in the previous 5 years. Based on the arrangements of the state "Seventh 5-Year Plan," the provincial government has initially drafted a Seventh 5-Year Plan for our province's economic and social development. This draft plan is hereby submitted for examination by this meeting. Now, I am going to make some necessary explanations concerning the basic tasks, goals of struggle, and major projects of this "Seventh 5-Year Plan."

The Seventh 5-Year Plan covers a crucial period in the economic the social development of our province. Under this plan, our province not only must undergo a fundamental transition from the old economic model to a new one but must also lay a firm material and technological foundation for realization of the strategic goals by the end of the century. To this end, the provincial government has put forward the basic tasks for the 1986-90 period as follows:

First, continuously implement the "decision of the CPC Central Committee on Economic Structural Reform" and unswervingly put reform in first place. Proceeding from Anhui's real situation, make the reform and construction cooperate with and adapting to each other, and strive to lay an initial foundation for the new socialist economic system within the next 5, or perhaps a few more, years.

Second, with raising economic results as the central theme, organize production and construction, resolutely expand reproduction, vigorously promote technological progress, exercise control over the total investments in fixed assets, and stress the construction of key projects in preparation for economic revitalization in the 1990's.

Third, vigorously developing scientific and educational undertakings, accelerate the development of intellectual resources and training of professional people, and strive to raise the people's scientific and cultural level, thereby building our economic growth on the foundation of scientific and technological progress.

Fourth, when production has been developed and economic results raised, further improve the people's livelihood in both the countryside and the cities, enable a majority of the people to begin a transition from having enough to eat and wear to a stage of being comparatively well-off, and accelerate the pace of combating poverty and making the people well-off.

Fifth, while vigorously building a material civilization, strengthen the building of socialist spiritual civilization. Inspire the whole society with a positive, onward, and enterprising spirit, promote the development of various cultural undertakings, raise the people's level of knowledge, and simultaneously propel the two civilizations forward.

In view of the above-mentioned tasks, our province's draft "Seventh 5-Year Plan" stipulates that by 1990, on the premise of continued improvement in economic results, the province's total industrial and agricultural output value should increase 55.2 percent over 1985 to reach 63 billion yuan, of which 20.5 billion will be in total agricultural output, an increase of 35.5 percent (or, including output from village-run industrial plants, an increase of 48.1 percent), and 42.5 billion will be in industrial output, increasing 67 percent (or, excluding the output from village-run industrial plants, an increase of 61.1 percent. The GNP will be 47.5 billion yuan, an increase of 50.8 percent over 1985. Total national income will be 40.2 billion yuan, an increase of 46.7 percent. Financial revenue will increase from 4.5 to 5 billion yuan, an increase of 49.5 to 66.1 percent. Total commodity retail sales will be 23.2 billion yuan, an increase of 61.3 percent. Total foreign trade will be $600 million, an increase of 95.5 percent.

To ensure fulfillment of the "Seventh 5-Year Plan," it is necessary to do down-to-earth work in 10 areas as follows:

1. /Maintaining a Modest Economic Growth Rate and a Proper Investment Scale; Readjusting the Investment Structure; and Promoting Sustained, Steady, and Coordinated Development of the Provincial Economy Marked by High Efficiency/

After striking an overall balance in accordance with the needs and possibilities of Anhui's economic and social development, the draft Seventh 5-Year Plan provides for an average yearly increase of 9.2 percent of the province's total industrial and agricultural output value growing at an average annual rate of 6.3 percent (8.2 percent if village-run industry is included) and the total industrial output value rising at an average annual rate of 10.8 percent (10 percent if the village-run industry is excluded). The total national product value is projected to increase at an average rate of 8.6 percent annually. These growth rates are somewhat lower than the actual growth rates achieved during the Sixth 5-Year Plan. The primary consideration is that the Seventh 5-Year Plan is a crucial period of reform requiring a fairly relaxed economic and social environment to ensure smoother progress in reform. Another consideration is the need to consolidate economic growth by drawing more attention from all quarters to the effort to improve product quality and economic efficiency. However, the projected growth rate of Anhui's total industrial and agricultural output value during the Seventh 5-Year Plan is still higher than the nation's annual increase of 6.7 percent. Given Anhui's relative economic backwardness and its many advantages and vast potential for development, and through an overall balance of its financial and material resources, it has been determined that the above relatively higher economic growth rate is appropriate, highly feasible, and attainable through hard work.

In working out the scheme for investment in fixed assets during the Seventh 5-Year Plan, we have conducted repetitious studies and come to recognize that: 1. It is necessary to adhere to the principle of acting according to our abilities. Efforts should be made to seek as much state investment as possible in tapping and utilizing Anhui's natural resources. According to preliminary statistics, the total 5-year investment in projects directly under the central authorities, or directly supported by the central authorities, or jointly financed by the central authorities, amounts to 5.66 billion yuan. After making all possible estimates and repeatedly balancing financial and material resources, investment in the capital construction of local units owned by the people has been initially set at 6.27 billion yuan, up 69 percent from the Sixth 5-Year Plan in real terms. Such an arrangement should meet the needs of economic growth on the whole. 2. It is necessary to ensure the construction of key projects. A total of 46 large and medium-size capital construction projects have been incorporated into the Seventh 5-Year Plan, including 25 projects related to the central authorities and 21 local projects. There are 21 above-quota technical transformation projects in the plan, including five projects related to the central authorities and 16 local projects. These projects are vital to ensuring a coordinated development of Anhui's economy and increasing its reserve strength. Accordingly, it is necessary to carefully organize efforts to carry out the work, ensure project quality, and complete the tasks on schedule. 3. It is necessary to readjust the local investment structure and improve investment returns. In readjusting the investment structure of light and heavy industries, priority should be given to ensuring the completion of projects which require small investment and shorter time limits and which can yield quick results, as well as projects that are technologically advanced, economically efficient, and capable of earning foreign exchange via export. Light and textile industries are the main parts of such projects. It is necessary to readjust the investment structure of productive and non-productive construction, with a proper reduction of the investment in non-productive projects, and to readjust the investment structure of capital construction and technical transformation. Initially planned for alteration during the Seventh 5-Year Plan is an investment amount of 4.289 billion yuan, accounting for over 40 percent of the investment in local fixed assets.

2. /Continue to Consider Agriculture the Foundation and Thoroughly Restructure Rural Production in an Effort to Rejuvenate the Rural Economy/

The general objective in restructuring rural production is to build a composite structure in which all forms of production will develop in a coordinated and harmonious manner, with agriculture as the foundation, so that such production essentials as resources, capital, labor service, and technical know how can be most effectively combined; a unity of economic, ecological, and social benefits can be achieved; an upward trend in rural economic development can be gradually achieved; and the peasants can become affluent more quickly. In crop farming, we must attach great importance to food grain production. On the basis of achieving a higher per-unit yield, we should maintain a steady increase in food grain, increase its variety, and improve its quality. According to the draft Seventh 5-Year Plan, food grain output in 1990 should reach 26 million metric tons, or 4.32 million metric tons higher than that of 1985, representing an average increase of 864,000 metric tons annually. Meanwhile, we should take positive steps to develop economic crops in accordance with market needs and natural conditions. In the agricultural sector as a whole. We should expedite the developemnt of animal husbandry, aquatic production, aquaculture, and forestry, and continue to exert efforts to expand their proportion in agricultural production. We should encourage the masses to plant trees, especially economically valuable trees, and pay attention to adjusting the tree varieties. In promoting the rural economy, we should help our rural enterprises achieve even greater growth. Developing the rural enterprises is the only way to rejuvenate the rural economy, and integrate cities and countryside and build a socialist society with distinctive Chinese characteristics. In developing rural enterprises during the Seventh 5-Year Plan period, we should continue to stress operation by one or several households. Attention should also be directed to consolidating, improving, and developing the mainstay enterprises in the rural areas so that the "six wheels" [liu ge lun zi 0362 0020 6544 1311] will revolve at the same time. We should give priority to processing of agricultural and sideline products, the development and multipurpose use of construction materials and mineral resources, and the development of tertiary industry. In a planned manner, cities should market their goods in the rural areas and transfer their technology and proficient personnel there. We should take full advantage of the demarcation of agricultural zones and, in a way appropriate to local conditions, set up complexes or small economic zones engaged in specialized production with each having its own distinctive characteristics and priorities, so that each village or township will have its special product or products, and so that different types of specialized markets can be developed in the rural areas. Then, with these small economic zones and specialized markets as bases, we should energetically develop socialized and systemized services in the rural areas, and speed up modernization of the rural areas by promoting all forms and all sizes of cooperation and ties. We should intensify the development of small towns so they will become centers of lcoal enterprises and commercial trade, as well as the rural areas' political, economic, cultural and information centers whose organic ties with cities will serve to promote economic cooperation between cities and rural areas.

To consolidate the agricultural foundation, the draft Seventh 5-Year Plan pays special attention to improving the conditions for agricultural production. According to preliminary estimates, approximately 1 billion yuan, or 93.8 percent more than the amount spent during the previous 5-year period, will be spent on agricultural, forestry, irrigation and gas supply projects during the next 5 years. We will continue to consolidate the Tongma and Wuwei enbankments along the Chang Jiang; harness the branches of the Huai He; carry out comprehensive development and control of the Chao Hu; complete the auxiliary projects of the Bi-shih-hang irrigation system [built in the area of the Bi He, the Shih He, and the Hangfu He in Anhui]; and improve management of the projects underway in order to improve the flood-control and irrigation capacity of these large rivers and their tributaries. We will continue to improve our soil, set up a number of bases producing quality rice, lean-meat pigs, fast growing and economic timber, famous tea, aquatic products, water fowl, fruits, minglu [2494 4845], and rare medicinal herbs. As the state continues to increase its investment, we should fully mobilize the peasants' initiative, increase accumulations of labor, and enlist the masses' efforts to take precautionary measures against harm by building flood-control and other beneficial public facilities.

During the first 3 years of the 1986-90 period, Anhui will give priority to disseminating 64 projects of agricultural science and technology, organize implementation of the "Spark Plan," help rural enterprises expand their production capacity, develop 10 showcase technologies that yield quick and economical results, and develop 20 showcase production lines to produce complete sets of practical equipment so that new scientific and technological know-how can blossom and yield results in Anhui's rural areas as quickly as possible.

3. /Accelerate Development of the Consumer Goods Industry, Improve the Quality of Products, and Explore Markets Inside and Outside the Province/

To satisfy the people's daily needs, the draft of the Seventh 5-Year Plan calls for a 10.6 percent average annual growth rate for light industry, faster than that of heavy industry, which is set at 9.2 percent. In the development of consumer industry, which is set at 9.2 percent. In the development of consumer industry, emphasis should be laid on those processing operations with farm, sideline, native, and special local products as raw materials and on the production of daily necessities and curable consumer goods to meet the people's needs. With regard to the food industry, continued efforts should be made to develop the production of basic foods, and production of famous and fine-quality wines and other beverages, and high- and medium-grade cigarettes should be stressed. In this connection, work should be done to continue the construction of a number of key enterprises and to upgrade others, including the Gujing Winery, the Mingguang Winery, the breweries in Hefei, Xuancheng, and Bengbu, and the Bengbu Cigarette Plant, in order to expand their production capacities and raise their product quality. In developing the durable consumer goods industry, we should focus our attention on the production of television sets, washing machines, refrigerators, and other electrical appliances. In developing the textile industry, we should make positive efforts to make new and high-grade synthetic, woolen, flax, and silk fabrics. Concerning the garment industry, efforts should be made to accelerate the production of fashionable clothes, children's clothes, sportswear, and work clothes and to increase the production of clothes made of down and leather. Energetic efforts should also be made to develop the manufacture of glassware, chemical products for daily use, furniture, plastic articles, and paper. In addition, we should promote the commercialization of housing in cities and towns and the development of the civil building industry so that it will gradually become one of the new backbone industries in our province.

In developing the consumer goods industry, we should do the following: first, we should increase investment. The draft Seventh 5-Year Plan calls for a total investment in capital construction for light industry, including textile production, of 1.044 billion yuan--a 90.3 percent increase over the Sixth 5-Year Plan--and stipulates that about 40 percent of the investment in upgrading technology and equipment in the province should be devoted to this industry. Second, we should continue to act on the principle of "six priorities" [liu ge you xian 0362 0020 0327 0341]. Third, we should proceed step-by-step with the establishment of production centers and raw material supply centers. Fourth, we should pay great attention to the quality and marketability of our products and go all out to turn out more famous-brand, high-quality products and develop new products and products that can be exported to earn foreign exchange. We should also see to it that our products have a better competitive edge and capture a large market share.

4. /Do Good Work in Energy Supply, Transport and Telecommunications, and Production of Raw and Semifinished Materials, Ensure Well-balanced Economic Development, and See to it that We have the Necessary Reserve Strength/

In our province, the supplies of energy and raw and semifinished materials are quite inadequate in meeting the demands, and transport and telecommunications are still in a backward state. During the Seventh 5-Year Plan period, we should accelerate the efforts in this regard with particular attention to some aspects of the work. We should do our best to complete the projects planned by the state and try to do more than meet the pre-set targets. At the same time, we should build our own local backbone projects in a planned and step-by-step way by pooling our financial and material resources through various channels as necessary.

Emphasis in developing the energy industry will be placed on electric power. In addition to ensuring the progress of work on the two state projects, namely the second-stage work on the Luohe Power Plant and the construction of the Pingwei Power Plant, we should build seven 125,000-kw generating units to be installed in Hefei, Tongling, Wuhu, and Maanshan, and every effort should be made to put five of them into operation during the Seventh 5-Year Plan. At the same time, we should actively assist various localities in building small hydroelectric power projects and try to make a success of the experimental electrification project in Jinzhai County. We should try to increase our province's annual electric power output to 23 billion kWh by the year 1990, or 72 percent more than 1985. By that time, power output by locally run power plants should reach 3.1 billion kWh, or a threefold increase. Meanwhile, continued efforts should be made to develop the coal industry. During the Seventh 5-Year Plan, we will continue construction work on eight mines and start to build four new ones. Construction of seven of them should be completed during this period. By 1990, the total coal output in our province should be brought to 36.35 million metric tons. Moreover, we should continue to develop energy work in rural areas by popularizing the use of firewood-saving stoves, promoting the production of methane gas, and growing forests to provide firewood. In developing energy work, it is necessary to carry out the principle of attaching importance to both developing new energy sources and economizing on the use of energy. We should see to it that energy equivalent to 4.3 million metric tons will be conserved within 5 years.

During the Seventh 5-Year Plan, we should make a comparatively big development in transport and telecommunications. In railroad construction, we should complete the Wuhu-Yuxikou center, double-track the Huainan Railroad, build the Fuyang-Luohe line, and make all necessary preparations for construction of the Shangqiu-Fuyang and the Xuancheng-Hangzhou lines. In highway construction, we should actively build a south-north highway and an east-west highway. At the same time, we should widen and renovate 18 main highways from Hefei to other prefectures and cities in Anhui. In county and township highway construction, we should emphasize dead-end roads and inaccessible outlying mountain regions. We should improve inland river channels, enhance their navigability, and promote river-sea coordinated transport. We should gradually develop local civil aviation. In telecommunications, we should emphasize expanding or building telephone service in all cities and counties, build the Hefei-Fuyang and the Hefei-Tunxi microwave lines, improve radio and television transmission means, and ensure that postal and telecommunications services are available to all villages.

In major raw and processed materials industry, we should emphasize increasing the production of products in short supply, increasing variety, and improving quality. The Maanshan Iron and Steel Company should complete all auxiliary projects to bring its overall steel production capability up to 2 million metric tons. It should complete the 400,000 metric-ton high-speed wire rod production line and build a 2,500 cubic-meter blast furnace. After transformation, the Hefei Iron and Steel Company should gradually develop its productive capacity to 500,000 metric tons of iron, 600,000 metric tons of steel, and 500,000 metric tons of rolled steel. We should actively develop industries for the production of building materials, such as cement, plate glass and ceramics for sanitary equipment. We should build the Tongling cement plant, expand the Baimashan cement plant and the Caohu cement plant, and complete a floating method [fu fa 3187 3127] production line at the Bengbu Plate Glass plant. We should build a 50,000 metric-ton acrylonitrile project at the Anqing Petrochemical Plant to enhance our self-sufficiency in raw materials for chemical fiber. All raw and processed materials industries must fully attach importance to comprehensive utilization. We should take a further step to improve geological surveying work and make all necessary preparations for rational development of mineral resources.

5. /Promote Technological Transformation of Existing Enterprises, and Improve Their Management and Quality/

To promote technological transformation of existing enterprises is a strategic task during the Seventh 5-Year Plan. All professions and trades should formulate feasible technological transformation plans and set correct technological policies and development orientations. The emphasis in technological transformation should be placed on key enterprises playing an important role in economic development, enterprises producing export goods, and enterprises producing raw and processed materials or consumer goods in short supply. The machine-building and electronics industries, which supply equipment to the economy, should undertake technological transformation ahead of others. We should pay attention to the development and application of high-tech products, such as microcomputers, optical fibers, and integrated circuits. In technological transformation, we should adhere to the following principles: First, we should concentrate on improving the quality and performance of products, increasing variety and lowering consumption. We should not unduly expand productive capacity, nor should we spend innovation and transformation funds on capital construction projects. Second, we should break the barriers of regions and departments in terms of ownership, break the traditional notion of being "large and all-embracing" or "small but all-embracing," and practice specialized cooperation. Third, we should select proper advanced technology and equipment on the basis of research. Fourth, we should integrate technology with trade, integrate industry with trade, increase software imports, and properly understand and use imported technologies. Fifth, we should set deadlines for transformation projects; for discontinuing the production of products that consume too much energy, are poor in quality, or seriously pollute the environment; and for eliminating backward technologies and equipment. Through the process of technological transformation, the state-run industrial enterprises in our province should by 1990 attain the 1985 level of advanced counterpart enterprises in China or Anhui in terms of the quality and major performances of products, and some of them should reach the world's advanced level of the late 1970's and early 1980's.

During the Seventh 5-Year Plan, we should attach great importance to enterprise operation and management. At present, we have a pretty clear understanding of the technological backwardness of our enterprises, but we usually lack sufficient understanding of the even more severe backwardness of their management. We should pay special attention to improving enterprise management. Enterprises and the departments in charge should accelerate the formulation of plans for advancing to a higher class and becoming advanced enterprises in accordance with the three-class enterprise criteria set by the state, and should work towards their objectives. We should exercise comprehensive quality control step-by-step according to plan, strengthen supervision over the quality of products, and institute and improve rules and regulations on energy and material conservation and on rewards and punishment. We should consolidate and improve the system where the director (manager) assumes full responsibility, and should popularize management experience that has proven effective in the course of reform. We should accelerate the training of full-time workers to improve their general knowledge and technical skills. In particular, we should improve the cadres' political quality, vocational skills, and management ability, and should promote those who possess both political integrity and ability to leading positions through the process of appointment, democratic elections, recommendation, or hiring. We should pay attention to labor protection and ensure safe production. After several years of effort, we should remarkably improve the quality of our enterprises.

6. /Make Great Efforts To Develop the Tertiary Industry and Promote a New Pattern of Economic Development/

The rise and development of tertiary industries is an inevitable trend resulting from social progress and enhanced labor productivity, as well as an important feature of the modern economy. During the Seventh 5-Year Plan, we should pay attention to the development of tertiary industry and should consider it a strategic measure to rationalize the production structure of our province. In the next few years, we should accelerate the development of transport, telecommunications, banking, insurance, commerce, tourism, and information, services in consideration of the reality of our province. At the same time, we should learn and use as much as possible new achievements of the world's technological revolution, and should properly develop some new departments of the tertiary industry.

We should attach great importance to commodity circulation, develop the socialist commodity market, further improve the wholesale commerce system, and run well various trade centers and specialized markets. We should actively experiment with new commercial forms--such as agriculture-industry-commerce, agriculture-commerce, and industry-commerce associations, and associations of commercial firms. We should encourage further the development of collective commerce, cooperative commerce, and individual commerce, and should gradually form an open, multi-sector, multi-channel urban and rural commodity circulation network in which state commerce and supply and marketing cooperatives play a leading role, operations are diversified, and there are fewer intermediate links. We should continue to develop various service trades that are necessary to the people's livelihood--such as barber shops, public bathhouses, repairing services, restaurants, and hotels--in order to convenience the livelihood of urban and rural people. At the same time, we should open up and build, step-by-step, markets for means of production, funds, technology, and information, and should promote the rational circulation of labor.

Tourism is an important economic sector. Our province has abundant resources for tourism suitable for exploitation. We should treat the development of tourism as a priority item in Anhui's economic development strategy, just as we treat industry and agriculture, putting them on our daily agenda and providing them with necessary support in funds, materials, and manpower. At the same time, we should reform the tourism management system to meet the needs of tourism development. In the next 5 years, we should concentrate on building a Huangshan-Jiuhuashan-Hefei tourism route. We should seriously develop the key tourist attractions of "two mountains and one lake" (Huangshan, Jiuhuashan, and Taipinghu). At the same time, all localities should build their own tourist spots with distinctive local features. We should gradually develop the tourism resources in central and northern Anhui, and should form a tourism network running throughout the province. It is necessary to build necessary basic facilities in support of tourism, and improve restaurant, hotel, transport, and recreational facilities in order to increase income and earn more foreign exchange.

It is necessary to further relax policy restrictions and institute the policy of pooling the efforts of the state, the collective, and the individual in promoting development of the entire tertiary industry. Preferential treatment in matters concerning prices, investment, and distribution should be adopted in light of the circumstances. Departments at all levels should concern themselves with and help and support the development of tertiary industry and create favorable social conditions conditions for its growth. It is necessary to strengthen the training of managerial and specialized personnel to upgrade their standards. Great efforts should be made to make tertiary industry meet the basic needs of production and the people during the Seventh 5-Year Plan. By 1990, the industry's output value should account for 23 percent of Anhui's total gross product, up from 19 percent in 1985.

7. Give Strategic Importance to Science and Technology and Education, and Accelerate the Development of Science and Technology and the Intellectual Resources

Scientific and technological progress constitutes the very source of sustained economic growth in our province. It is necessary to increase our input in science and technology and make scientific and technological progress an important criterion in evaluating the performance of our enterprises, departments, and localities. Research departments and college research institutes should orient their work to economic construction and accelerate the application of their research results. It is necessary to gradually establish and expand the technology market and promote the transformation of science and technology into productive forces through remunerative transfers and joint development. It is necessary to organize joint efforts to tackle key scientific and technological problems in Anhui's economic construction and social development, and strive to produce new research results. It is necessary to absorb the fruits of the world's new technological revolution, selectively open a number of new technological fields, and establish, step-by-step, a number of new industries.

The draft Seventh 5-Year Plan provides for increased investment in education. During the 5-year period, our province will allocate from its revenue 4.098 billion yuan for education, an 83.4 percent increase over the Sixth 5-Year Plan. This increase is higher than the national average and far exceeds the increase in Anhui's current revenue. In addition, local government at various levels will increase its education appropriations as much as possible. It is necessary to effectively use education funds and pay attention to investment returns. It is necessary to mobilize all sectors of society to complete all kinds of educational undertakings. Educational institutions of all kinds and at all levels must implement the policy of development in a comprehensive way--morally, intellectually, and physically--raise the quality of education, and bring out qualified personnel. It is necessary to pay close attention to preliminary education and gradually enforce the 9-year compulsory education system. By 1990, primary education should become basically universal in the entire province, and middle-school education should become universal in cities and county towns. It is necessary to vigorously develop vocational technical education, conduct pre-employment training, and gradually bring secondary vocational technical school enrollment to the level of regular high school enrollment. According to the plan, some 289,000 students will graduate from secondary specialized or technical schools in the coming 5-year period, a 30-percent increase over the Sixth 5-Year Plan. It is necessary to tap the potentials of our existing colleges, appropriately renovate and expand some of the colleges, readjust the academic departments and special fields of study, accelerate the development of weak and new academic departments and departments in great demand, and constantly seek to improve teaching qualities. According to the plan, some 57,000 students will graduate from provincial colleges during the coming 5 years, a 50.9 percent increase over the Sixth 5-Year Plan. Some 1,060 students will complete post-graduate studies, a 650-percent increase. Worker education and other types of adult education should be gradually developed through consolidation and improvement. Television education by satellite should become an important means to developing adult education. Under the plan, adult institutions of higher learning will turn out 110,000 specialized personnel, a 420-percent increase over the Sixth 5-Year Plan. Serious efforts should be made to run teachers schools and accelerate the training of teachers in order to gradually build a contingent of teachers who will meet our basic needs in terms of numbers, standards, and specialities.

It is necessary to further implement the policy toward intellectuals and perform good service to them in a down-to-earth manner. Special efforts should be made to improve the working and living conditions of the middle-aged intellectuals so they can concentrate on their work. It is necessary to institute a system of hiring for technical posts so the intellectuals can use what they have learned and fully play an active role in the magnificent cause of the four modernizations and in revitalizing Anhui.

8. /Further Rationalizing Geographical Distribution of the Regional Economy and Integrating Key Construction Projects with Balanced Regional Development/

During the Seventh 5-Year Plan, it is necessary to fully exploit the advantages of various localities and gradually establish economic networks around cities at different levels, of varying dimensions and with distinctive characteristics in order to promote socialized large-scale production and the development of a commodity economy.

In northern Anhui areas, we should exploit the local advantages in agricultural production, the processing industry for agricultural and sideline products, and the availability of energy resources; develop intensified processing work; and attach importance to comprehensive utilization of all resources. During the Seventh 5-Year Plan, we should do a good job in harnessing the main stream of the Huai He, improving soil conditions, building production bases of agricultural products for marketing purposes, and promoting the construction of coal mines, electric power plants, and other key construction projects. At the same time, we should actively develop food industry, village and town enterprises, light and textile industry, and tertiary industry.

The central Anhui areas surrounding Hefei have a relatively good foundation of science and technology and are more advanced in industrial and agricultural production. During the Seventh 5-Year Plan, it is necessary to continue to vigorously develop traditional production, pay attention to adopting new technology and carrying out technical transformation, actively develop appropriate new industries, and promote the development of new industries such as knowledge- and technology-intensive industries manufacturing high-grade consumer goods. We should exploit the advantage of people's higher education and economic progress in the Hefei areas and have the areas assist the development of the surrounding areas.

In areas along the Chang Jiang, we should stress developing steel, nonferrous metal, cement, and other raw materials industries, light and textile industries, ship-building industry, food industry, and agricultural production. We should give full play to the role of the Chang Jiang as a "golden waterway," strengthen economic cooperation with the upper and lower reaches of the river, and expand our opening to the outside world.

In southern Anhui areas, we should first grasp agricultural, forestry, and tea production and at the same time speed up the development of tourism. We should also actively promote industries which use raw materials produced in mountainous areas. In line with the development of industry, agriculture, and tourism, we should also promote the development of transportation, communications and commerce, and the construction of other basic facilities.

During the Seventh 5-Year Plan, an important task in regional economic development is to mobilize people in the old revolutionary base areas in west Anhui, in some mountainous areas of southern Anhui, in old disaster areas along the Chang Jiang, and in floodwater storage areas along the Huai He and whip up their revolutionary spirit to speed up economic construction. In the floodwater storage areas along the Huai He, we should pay attention to harnessing the river, continue to adjust the production structure, and do a good job in village building. We should also take effective measures to improve the people's livelihood. In other areas, we should quicken the pace in improving the people's economic condition and strive to solve the problems of food and clothing within 3 years and eliminate poverty within 5 years. Various departments at all levels should conscientiously implement the requirements set by the central authorities and this province on improving the outlook of poor areas, implement the responsibility system in helping poor people, and support those poor areas with good policies, funds, supplies, manpower, and technology. The most important thing is to strengthen our efforts to help poverty-stricken areas with science and technology, develop production suitable for operation in poverty-stricken areas, and increase the capability of self-development in those areas.

We should pay attention to land use and work out plans for the preservation of soil fertility, strengthen centralized control of land, set limits for land use, and strictly handle according to the law cases of wanton occupation of farmland by various units and individuals. In addition, we should improve environmental protection work, stress disposing of the "three wastes," and promote an ecological balance.

9. /Continue to expand foreign economic relations, strive to develop lateral economic ties./

During the Seventh 5-Year Plan, we must further expand contacts with foreign countries, strengthen economic and technical cooperation, strive to create good conditions for opening to the outside world, and promote great development of foreign economic relations and trade. First, of all, we must strive to increase exports and earn more foreign exchange. While we improve the quality of export products and increase the rate of fulfilling contracts, we must also continue to expand exports of traditional products, develop exports of machinery and electrical products, and promote processing work with raw material and patterns furnished, compensatory trade, cooperative production, and joint ventures. We must establish in a planned way export commodity production bases and specialized plants (specialized workshops), adopt a policy of encouraging exports, and develop exporting enterprises' enthusiasm for production. It is necessary to improve import work and to strictly control imports of durable consumer goods and ordinary processing equipment which can be produced at home. It is necessary to speed up using foreign funds and expand the scope of importing technology. According to plan, foreign funds to be used in the coming 5 years total $458 million, an increase of 140 percent over the Sixth 5-Year Plan. Our technology imports will cost $456 million, an increase of 76.7 percent over the Sixth 5-Year Plan.

Lateral economic ties are requirements for the development of a socialist commodity economy and modern production. Vigorously developing lateral economic ties can create a new superior situation and produce better economic results and social benefits. In this superior situation, advanced enterprises can avail themselves of the opportunity to develop, while backward ones can improve, and some enterprises on the verge of bankruptcy can be brought back to life. During the Seventh 5-Year Plan, it is necessary to create a new situation in promoting associations in the sphere of production, between production and scientific research, and between production and circulation. It is necessary to promote the rational development of resources and rational disposition of productive forces and to improve the structure of industry, enterprises, and technology so as to speed up the birth of a unified socialist market. It is necessary to regard a certain number of famous-brand and good quality products and some large-and medium-sized enterprises as models and to form different types of enterprise groups and colonies step by step. It is necessary to create conditions for the development of lateral economic ties in structure, policy and other aspects.

10. /Further improve urban and rural people's living by developing production and increasing economic results./

During the Seventh 5-Year Plan, our province is in the peak period of a new baby boom. Therefore, it is necessary to continue grasping birth planning well to strictly control population growth. We must keep our province's population around 54 million in 1990. With this requirement in mind, we must strive to solve the question of unemployment and expand the sources of workers' incomes. It is necessary to create more productive jobs in rural areas and organize the surplus labor force to engage in production and create social wealth. In urban areas, it is necessary to make plans to create jobs for 750,000 new unemployed youths within 5 years, including 250,000 jobs in state enterprises, 400,000 jobs in collective enterprises, 50,000 jobs to be created by the youths themselves under guidance, and 50,000 temporary jobs. Thus, the all new labor force grown up during the Seventh 5-Year Plan can receive appropriate placement.

To raise the income and consumption level of rural and urban residents is a major target of the draft Seventh 5-Year Plan. In the year 1990, the per capita net income of peasants in Anhui should reach 520 yuan, topping that of 1985 by 151 yuan and representing an average annual increase of 7.1 percent; the per capita actual income of workers and staff should be 1,213 yuan, rising above 1985 income by 263 yuan and representing an average annual increase of 5 percent. On the basis of increased income, the people's actual consumption level will rise, the consumption structure will improve, and consumer goods will be increasingly varied and colorful.

It is necessary to further improve the people's living conditions and environment, as well as the quality of their life. During the Seventh 5-Year Plan, efforts should be made to step up the construction of the urban infrastructure and public facilities in villages and towns so that the living conditions of ordinary people can be bettered in a planned manner. It is necessary to considerably increase the numbers of commercial and service outlets and strive to open up and expand service areas. Efforts should be made to promote various cultural undertakings in literature, arts, cinema, radio and TV broadcasting, sports, public health, press, publications, libraries, and museums. In 1990, multi-channel TV broadcasting should be received by 80 percent, and multi-station radio broadcasting by 85 percent, of Anhui's population. We should go all out to unfold the patriotic health campaign and promote medical and health undertakings. Within the next 5 years, the number of hospital beds should increase by 10,000 to reach some 94,500. It is necessary to raise the quality of professional physical cultural workers and vigorously launch mass sports activities in order to continuously enhance the physical fitness of the masses. Various social welfare systems should be improved and a new social security system should be introduced step by step.

Fellow deputies:

The fighting goals set in Anhui's draft Seventh 5-Year Plan are gigantic. Successful fulfillment of the Seventh 5-Year Plan will greatly change our province's economic and social outlook, straighten out the relationships between various economic sectors in general, build up our economic strength markedly, and guide the economic system to basically embark on a new road. Thereafter, we will advance, with full confidence and steady strides, toward the comprehensive vigorous economic growth in the 1990's.

III. /Pay close attention to the work of 1986./

According to the Seventh 5-Year Plan, Anhui's total industrial and agricultural output value of 1986, the plan's first year, should be 45.4 billion yuan, an increase of 11.8 percent over that of 1985. Of that, the agricultural output value should be 16.1 billion yuan, an increase of 6.4 percent (including a 10.8 percent increase in village-run industry); the industrial output value should be 29.3 billion yuan, an increase of 15.1 percent (12.8 percent, if village-run industry is excluded). The financial revenues should reach 3.35 billion yuan (excluding revenues and expenditures for price subsidies), an increase of 11.3 percent. As the 5-year plan depends on our performance in the first 3 years, for which the work in the first year is crucial, a successful job done this year will create favorable conditions for the development in the next 4 years. We must motivate ourselves, make active efforts to overcome difficulties, and advance with steadfast and firm strides. To this end, it is necessary to pay close attention especially to the work in the following fields:

1. /Consolidate, assimilate, replenish, and improve various reform measures./

To give top priority to the reform is a prerequisite for ensuring a comprehensive fulfillment of the Seventh 5-Year Plan. We have relied on the reform in scoring achievements, and will continue to rely on it in making progress. We should resolve problems cropping up in the course of reform through upholding and deepening the reform, and we should by no means go backwards. Current unhealthy practices are not the inevitable results of opening to the outside world and invigorating the domestic economy. On the contrary, they interfere with and undermine opening to the outside world, invigorating the domestic economy, and reform and should be firmly dealt with. The purpose of rectifying unhealthy tendencies is to further facilitate reform and ensure that the opening, the invigoration of the domestic economy, and the reform advance along a wholesome track. Mistakes committed by comrades in the work due to the lack of experience and knowledge in the reform are different from unhealthy practices of exploiting loopholes of the reform. They are problems of two different natures. It is necessary to distinguish and draw a line of demarcation between these two types of problems in order to protect the reformers' initiative and help them draw lessons from the work to ensure reform's steady advance. The work of reform in 1986 is primarily to penetratingly and meticulously consolidate, assimilate, replenish, and improve reform measures while making adequate preparations for bigger strides of reform in the next year and after. The task of reform remains formidable.

Further injecting vitality into enterprises, particularly state-run large-and mid-sized enterprises as well as foreign-exchange earning enterprises, is the key element in reform. We should continuously and seriously implement various stipulations and regulations on enterprise invigoration laid down by the CPC

Central Committee, the State Council, the provincial CPC Committee, and the provincial people's government. Complete decision-making power should be delegated to enterprises; city authorities should not curtail enterprises' power. We should step up supervision over and streamline our administrative departments and reduce the number of unnecessary levels of management. Enterprises should effect thorough internal reforms and improve diverse forms of the economic responsibility system. Some small enterprises owned by the whole people may change to collective or individual ownership.

In addition to consolidating results in pricing and wage reforms, we should assimilate and supplement present reform measures. Last year saw a great stride made in pricing reform. This year we should strive to maintain a basic stability in market prices. Special attention should be paid to urban price work. Regarding the supply of major nonstaple food such as vegetables, meat, poultry, and eggs, we must pay attention to the urban-rural relationship, taking into consideration the interests of the producers, distributors, and consumers, and striving to stabilize price levels. Vegetable growing suburbs should stabilize growing areas, set up plastic sheds to protect vegetables, and subsidize vegetable growing with industrial and commercial taxes. Establishment of second-line and third-line reserve vegetable bases in a systematic manner is also called for. State-run vegetable companies should play the roles of main suppliers, do a good job in peak and slack season regulation, and hold down vegetable prices. Except for those of a very few approved articles, prices of industrial goods will not be allowed to go up this year. Plants should try to offset increased production costs because of higher material costs by means of management reform or through improved work efficiency. Supervision on levels of accommodation charges at hotels should be seriously carried out; hotels are forbidden unauthorized increases in accommodation charges. Control, supervision, and inspection of commodity prices should be further strengthened. Pending problems during wage reform in organs and enterprises should be promptly dealt with. Regarding wage reform in enterprises, we should seriously review past work and solve existing problems. We should try to make a smooth linkup between results of wage reform and the responsibility system.

We should continuously do a good job in the comprehensive reform of the country-level economic structure; sum up results and experience of comprehensive reform in trial counties; achieve fresh progress in reforming the eocnomic structure and improving the service system; and further perfect and complement reforms. We should continuously expand county-level decision-making power and step up offering specific guidance to county-level economic structural reform. Experience gained in 23 trial counties should be spread throughout the province. Room for maneuver should be left for the counties with regard to price control on sideline agricultural products. Counties should be permitted to proceed from reality and adopt flexible ways. Departments concerned should take the initiative in offering services and guidance to develop the county-level economy; they should refrain from abusing their power to intervene administratively.

Lateral economic ties should be vigorously promoted. Promoting economic benefits and economic reform through lateral economic ties is one of the key points of this year's reform. In going about lateral economic ties, we should adhere to the principles of voluntary participation, mutual interests, and joint development; attention should be paid to economic and technological capabilities; and instead of a single form of economic cooperation, diverse forms of lateral economic ties should be tried. Overall guidance should be strengthened to prevent blind expansion of the scale of key construction projects and avoid construction duplication. We should especially promote cooperation between enterprises engaging in processing industry and the raw and semifinished materials industry; ordnance enterprises and civil enterprises; industrial enterprises and scientific research units, universities, colleges; and cooperation between agricultural, industrial, and commercial enterprises. In engaging in regional economic cooperation, we shouls seek truth from facts, make the best use of the situation; and in accordance with the inherent law of the economy, promote rationalization of the regional economic, industrial, and production structure.

2. /Make every effort to win a bumper harvest this year./

We must be sober-minded and note our agricultural production problems this year. Sustained rain during the autumn sowing season last year forced us to postpone the sowing work. Then, drought was experienced in the ensuing winter and spring. All these seriously affected the growth of wheat and rape. Even though the growing condition of these summer/ripening crops has been improved due to the efforts made in various localities to strengthen field management and the recent timely rain, production is still expected to be less than last year. While continuing to strengthen the late-stage field management for our summer-ripening crops, we should make proper arrangements for the autumn-ripening crops. More early- and middle-season rice, hybrid rice, corn, sweet potatoes, and miscellaneous cereal crops should be grown so that we will have a better autumn harvest to make up for the poor summer harvest. The leadership at all levels should in no way take lightly the unfavorable factors for this year's agricultural production, but they should uphold the idea of combating all disasters to win a bumper harvest and take effective measures against both flood and drought so as to avoid being subject to natural adversities. In other words, every effort should be made to achieve a high agricultural output.

Further efforts should be made to implement the policies contained in Document No 1 issued by the CPC Central Committee this year. We should continue to readjust our production structure according to the principle of "never relaxing in grasping grain production and energetically developing diversified operations." We should rely on science, increase investment, and stir up the peasants' enthusiasm to grow grain corps so as to fulfill the grain/sowing plan. At the same time, various effective measures--such as implementation of certain principles and policies, application of science and technology, and improvement of management--should be adopted to promote the production of cash crops and the development of industry and sideline operations according to market demands. We should take it as a long-term policy to develop industry and sideline operations to support farming and to grow cash crops to supplement grain crops. Through the system of contract purchase, we should "use industry to supplement agriculture" and "use sideline operations to support agriculture" in an effort to bring about all-round prosperity of our rural economy. This year we should achieve the goal of one steady increase--the steady increase in grain output--and four new breakthroughs--the breakthroughs in the development of animal husbandry and acquatic production, village and town enterprises, forestry, and the flow of commodities.

In addition, we should make a success of the various tasks that serve the needs of agriculture. With the development of the rural commodity economy, many of the above-mentioned tasks cannot be done successfully by a single family or household. This question can only be solved by the development of socialized services. We should step up the development of socialized service organizations and facilities of various types, natures, and sizes and make a success of the various services, including the services before, in the middle of, and after production. Energetic efforts should also be made to guide the peasants to use these service organizations and facilities as a starting point to gradually develop a cooperative system and finally make it perfect. All professions and trades should do their utmost to support agriculture, while agricultural departments are required to reinforce their ties with, and take the initiative to obtain support from, banking, financial, commercial, grain, supply and marketing, chemical industry, and electric power departments. Departments of agricultural science and technology should organize a work force to be sent to the rural areas to give guidance on scientific farming and render technical service required by the peasants. Indiscriminate collection of levies and fees should be strictly prohibited so as to lighten the peasants' burden. Assistance to the poor should be continued so that both the poor and the well-to-do will embark on the road of common affluence. There are countless tasks involved in agriculture, but once we have grasped the policy and service, we have truly grasped the vital points.

3. /Ensure sustained and steady growth of industrial production./

Our industrial growth rate for the first quarter of this year was 8 percent, a rate which ranked among the highest industrial growth rates in the country but is still less than the planned target. This was mainly attributable to the fact that our efforts were somewhat relaxed in January and February, that we had insufficient circulating funds, and that there was a shortage in the supply of raw and semifinished materials. Recently the provincial people's government has called a meeting to analyze the economic situation and has adopted necessary measures. At present, we should emphasize the following:

We should overcome the tendency to relax efforts and do everything to ensure the fulfillment of the production plan. By opposing one-sidedly seeking a high growth rate, we do not mean that the lower the growth rate, the better. Still less do we mean that we can relax our production efforts. What we should do is to maintain a reasonable growth rate while improving product quality and putting stress on economic efficiency. Without a reasonable growth rate and a real increase in production, it will be impossible to improve economic efficiency, meet the growing market demands, and contribute more to the state's accumulation, and what is more, even the process of reform may be affected. Therefore, it is imperative to seriously analyze the situation to find out both the favorable and unfavorable factors and mobilize the broad masses of staff members and workers to fulfill their production quotas every month and every quarter without fail.

It is necessary to strengthen ideological and political work among enterprise cadres, workers, and staffs. Economic work is the central task, and ideological and political work guarantees the smooth progress and healthy development of economic work. It is necessary to correctly handle the relationship between an enterprise and the state. An enterprise's leading cadres must lead workers and staff to make great contributions to the state and share the state's difficulties. They must not compete with one another for personal income. They must correctly handle the relationship between leading cadres and workers and put the workers' interests above all else anywhere and anytime. They must correctly handle the relationship between immediate and long-term interests. While appropriately increasing the distribution of personal income, they must pay attention to an enterprise's accumulation from production so as to increase reserve funds. It is necessary to properly solve according to policy questions concerning allocation of funds, do ideological and political work well, and develop the workers' enthusiasm for production.

It is necessary to maintain comprehensive control over and a balance of funds, raw and other materials, energy resources, and communications and transport. The shortage of energy resources, raw and other materials and, in particular, circulating funds is an important factor affecting this year's industrial production. Monetary and management departments and in particular materials through various channels to serve enterprises and create conditions for the steady increase of production in a coordinated way. It is necessary to guarantee on a first priority basis the supply of circulating funds to enterprises whose products are marketable. In addition, it is necessary to solve the question of inadequacy of circulating funds for newly built enterprises. It is necessary to launch mass activities of tapping potentials, practicing thrift, and increasing production and income and let all people make contributions to developing production and increasing economic results.

It is necessary to increase by big margins products which are in short supply and products which are marketable. It is necessary to continue readjusting the composition of products in accordance with market demand and the demand set by the provincial economic development plan. We must see to it that the products which are no longer marketable should not be produced. Our limited manpower and material and financial resources must be used in most needed trades and for the production of most needed products. It is necessary to strengthen the coordination and balance within a trade, strive hard to eliminate any obstruction, and spur the development of the trade as a whole.

It is necessary to further coordinate the relationship between industry and comemrce. Industrial and commercial departments must take the initiative in coordinating with each other and exchange production and marketing information. The industrial departments must guarantee the production of products under mandatory planning. They must regard the fulfillment of the state plan as their own responsibility and maintain the solemn nature of the plan. The commercial departments must actively replenish their stock and help plants open up markets and sell their products. They must use their numerous channels and well-informed sources to fully understand the composition of commodities and the supply and demand of the principle assortments of goods. They must make suggestions on increasing production of products whose supply falls short of demand and must help industrial departments solve appropriately the question of inadequate raw and other materials for light and textile industries. Both industrial and commercial departments must correctly handle the relationship between departmental benefits and social benefits, actively develop production, and improve supply.

4. /Expand and speed up commodity circulation./

At present, our province enjoys a stable market, but there are great hidden pressures. The province's first quarter retail sales increased by 6.3 percent, lower than the 35.6 percent increase in the corresponding period of last year. In addition, surplus buying power increased by some 30 percent over the end of 1984. Urban and rural residents' savings deposits increased by over 388 million yuan, an increase of 21 percent over the corresponding period of last year. Consumers' demand for commodities is very strong. It is necessary to continue attaching great importance to both circulation and production, expand and speed up circulation, and further improve supply.

We should break down barriers of administrative regions, follow an open-door policy, and promote the two-way circulation of industrial products and agricultural and sideline products. In order to develop lateral economic ties, various plants may operate jointly with producing areas of raw materials or with wholesale departments in marketing their products. Durable consumer goods' manufacturing plants and marketing units may be organized into integrated enterprises. The main producing areas and main marketing areas for pigs, poultry, eggs, vegetables, and other, nonstaple food products may also operate in a joint manner on a trial basis. Various retail stores may be organized into an association which can purchase goods directly from plants and distribute them among retail units. State-run commercial facilities should serve the whole society. Trade centers should be improved through reorganization and gradually turn themselves into economic entities to provide various services.

We should develop the role of commercial departments, actively promote the flow of commodities within and outside the province, and extend procurement and sales to distant localities. Through developing a "showcase" economy, we should organize a marketing network to promote the sale of Anhui's products in other localities. We should adhere to the principle of "whoever makes the investment receives the benefits." The state, collective, and individual should all work hard to promote commodity circulation.

We should give full play to the leading role of state-operated commercial enterprises. We should establish a reasonable stock of important commodities which are related to the national economy and people's livelihood. We should further expand the decision-making power of state-run commercial enterprises, raise the amount of profits to be retained by large and medium-sized commercial enterprises to an appropriate level, and further activate the operation of small state-run commercial enterprises. The rebuilding and expansion of commercial enterprises should be treated in the same way as the technological transformation of industrial enterprises. In promoting the circulation of rural commodities, we should first try hard to promote the procurement and marketing of grains and other agricultural and sideline products. We should further improve the contract system, improve service attitudes, raise service quality, and strive to turn commercial enterprises into a "showcase" of spiritual and material civilization.

5. /Strive to increase income and reduce expenditures, use funds in a flexible and lively manner./

In 1985, state revenue increased relatively quickly in this province, but expenditures increased even faster. Many new factors have emerged in state expenditures this year. The increased expenditures for wage reform, meetings, and official trips alone account for two-thirds of funds which can be increased in this province. The remaining portion of increased funds available for this province has to be used for expenditure increases for education, scientific and technological research, agricultural investment, various kinds of relief, and subsidies to units related to the reduction of prices for some chemical fertilizers. Therefore, funds which can be used in construction work will be very limited. During the first quarter of this year, state revenue increased by 11.1 percent compared with the same period last year, fulfilling 22.4 percent of the annual plan but not reaching the average requirement in gaining revenues. People's governments at various levels must conscientiously grasp financial work well and strive to fulfill the state revenue plan for this year.

It is necessary to develop and expand revenue sources and vigorously increase revenues. We should mobilize and organize various enterprises to strive to increase production, expand circulation, and raise economic results in order to create more profits and be able to pay more taxes. In light of problems discovered during the general investigation on tax collection, financial conditions, and commodity prices, we should adopt appropriate measures, establish and improve necessary rules and regulations and methods for supervision and investigation, and promptly and fully collect all money due the state. According to the State Council's decision, we should conduct general investigation on tax collection, financial conditions, and commodity prices every year for several years to come. We should strengthen auditing work and actively improve macro-control and strengthen economic management. We should continue to improve the finances of townships and towns, implement the financial system of "fixing a certain amount of income and expenditures with additional income distributed according to a set proportion and the unused portion used later, "whip up the enthusiasm of the grassroots level units in managing money matters, and reduce their dependence on higher level units for financial matters.

We must strictly control state expenditures and be industrious and thrifty in doing everything. This year's state expenditures are mainly for food supply, educational development, agricultural progress, normal administrative work, and relief for needy people. Expenditures for all other purposes must be kept within the limits of state revenues, and disbursements must be controlled according to the availability of funds. The provincial people's government has issued a "circular on strictly controlling state expenditures," formed an examination group for the approval of state expenditures, and is strictly controlling expenditures. Since the end of last year, the party Central

Committee and the State Council have issued a "circular on solving some serious problems in the workstyle of various offices at present" and several other documents. All localities and departments must conscientiously implement them, combine economical use of funds with the struggle against unhealthy tendencies, and firmly curtail administrative expenditures. At present, various units have made many requests to solve their respective problems. Most of their requests are quite reasonable. However, we are limited by the objective conditions and available resources, and it is impossible to "undertake numerous tasks at the same time." We can only concentrate on solving some problems at a time. If we list too many items and expenses, things will go contrary to our wishes.

We must use funds in a more flexible and lively manner. We must make vigorous efforts to increase deposits. The People's Bank and other specialized banks should all strengthen their management of funds, make flexible adjustments in the use of funds, actively promote lateral ties, speed up the turnover of funds, fully tap their potentials, and increase the usefulness of funds. We must also help various enterprises dispose of their unsold stocks and liquidate their outstanding loans. Governments at the provincial, city, and county levels should all systematically establish financial markets to promote economic development.

6. /Strengthen the building of socialist spiritual civilization and the legal system./

In his "Report on the Seventh 5-Year Plan," Premier Zhao pointed out: "It is our established long-term strategic policy for the entire historical period of socialism to promote the cultural and ideological advance of socialist society while furthering its material progress." In order to strengthen the building of spiritual civilization, we must speed up the development of education, science, literature, art, and other cultural work on the one hand and strengthen ideological building on the other. Under the new historical conditions, the invasion of corrupt capitalist ideology and the capitalist way of life, the growth of the idea of seeking personal interest and money in disregard of state and collective interests, and the damaging influence of unhealthy tendencies on social customs have indeed endangered the successful implementation of our policy of carrying out reform and opening to the outside world and impaired the further development of socialist material civilization. We must realize the serious nature of the problem and adopt effective measures to solve it.

We must firmly grasp ideological and political work for carrying out reform and opening to the outside world. We must strengthen education on the current situation and on policies for all cadres, staff and workers, and intellectuals. We must also strengthen education on the four cardinal principles and on the lofty ideals of communism, patriotism, socialist morality, and discipline in order to enable the broad masses of cadres and people to clearly understand the situation, unify their thinking, have common ideals and discipline, raise their ability to resist corrosion by various kinds of corrupt thinking, and consciously plunge themselves into reform and construction. We must set right our guiding ideology for workers on the cultural and theoretical fronts. Units which produce and disseminate spiritual products must strive to raise their workers' political and professional quality, keep to the four cardinal principles and the policy of serving the people, strengthen propaganda on discipline, place social benefits in first place, and provide more and better spiritual nourishment for the people. We must firmly resist literary and art works which may corrupt the people's soul and poison the minds of young people and children, and must also oppose the tendency of bourgeois liberalism.

We must persist in promoting construction and the legal system at the same time. Leaders at all levels must conscientiously study the guidelines of Comrade Deng Xiaoping's important speech on the matter to effectively raise their understanding of socialist democracy and socialist law, take the lead in studying legal knowledge and understanding and observing the law, and further strengthen public security and judicial work. One major content of the drive for spiritual civilization is the popularization of legal knowledge among citizens in a planned, step-by-step, and systematical way.

This is a grand social project. This year, the first year in the 5-year drive to popularize legal knowledge, we must mobilize forces in all quarters and make a good start by promoting the drive with serious and practical efforts. It is imperative to unswervingly implement the principles of giving heavier punishment at a faster speed as permitted by the law in our efforts to deal severe blows at criminal activities that seriously harm social order. Comprehensive efforts to stabilize and improve social order should be stepped up in order to build a solid foundation to enable us to fundamentally improve social order. Serious economic criminal activities should be cracked down with the firm resolve to ensure the smooth development of the reform of the economic structure and the drive for modernization.

The rectification on unhealthy practices calls for both firmness and persistence. We must firmly stop unhealthy practices among cadres, including engaging in commercial activities and running enterprises, sending personnel abroad in a haphazard manner, squandering public funds on pleasure tours, indulging in extravagance and waste, entertaining guests, presenting gifts, and giving bribes. Nothing is more effective in curbing such practices than having the leading organs and leading cadres set an example. People's governments and leading cadres at all levels must carry out earnest investigation of unhealthy practices in their respective offices and departments, solve problems one by one, and institute practical and enforceable rules and regulations to deal with these problems. In the recent past, there have indeed been a very small number of cadres, including a very small number of leading cadres, who collude with lawless elements in society to use their powers for personal gains and carry out other activities in violation of law and discipline. This has caused extremely serious harm. We must first deal with major and serious cases, adhere to the principle of both accuracy and speed, dare to handle tough cases without being softhearted, and be determined to make a thorough investigation to find out all the facts about any organization and any person concerned, at any level. We must see to it that laws are strictly observed and enforced and that lawlessness is punished. We must understand that everyone is equal before state law and government discipline.

It is necessary to promote the building of grassroots-level political power in the rural areas. We must make sure that leading bodies meet the requirement of being composed of cadres who are politically more aware, younger, better educated, and professionally more competent; we must enforce the division of administration and operation and see to it that township governments function in a sound and flawless manner. The building of political power should conform to the new situation of reform of the economic structure in the rural areas, and promote the development of the rural economy. We must promote the building of villagers' committees by carrying out ideological consolidation and reorganization; establish and perfect various organization and work systems, including those for people's mediation, public security, culture and education, public health, and social welfare; and perfect villagers' convention and pacts. We must build up rural grassroots political power in every administrative area into one which is full of vigor and authority and capable of leading and running the area's political, economic, cultural, and various other activities.

Fellow deputies,

In order to effectively promote the vigorous development of reform and economic construction, governments at all levels must strive to upgrade their work to a new level by adhering to the basic principle of wholeheartedly serving the people, improving the style of work, and raising work efficiency.

Governments at all levels must unswervingly focus attention on economic construction and make sure that work in all other areas is subordinate to and serves this focal point. Meanwhile, they must realize that there should be balanced development in all fields of work by taking everything into consideration. In the Seventh 5-Year Plan period, the transition of the government organs' managerial function from one of direct control over enterprises to one of indirect control should be speeded up to establish a new socialist macroeconomic management system. The nature of the work of economic management departments at all levels should be changed. Instead of directly organizing production and distribution of products, these departments should shift their work to mapping out plans for the entire trade, supervising and coordinating the whole trade's efforts, and serving it. Instead of depending mainly on administrative means, they should depend mainly on economic and legal means in doing their managerial work, and strive to achieve the objective of having managerial work serve enterprises.

Leading cadres at all levels should study hard the basic theory of Marxism, persist in linking theory with practice, constantly raise their consciousness of implementing policy, and raise scientific levels in decision-making and problem-solving. At present, special attention should be paid to studying Premier Zhao Ziyang's "Report on the Seventh 5-Year Plan" and important documents of the Fourth Session of the Sixth National People's Congress and to implementing them earnestly in actual work. Also, we should earnestly study science and technology, raise our cultural level, and acquire management and other professional knowledge; we should learn to do things in accordance with economic law so as to better perform our duties entrusted by the party and the people.

Governments at all levels, and all departments, should gear themselves to the people's needs, go deep down among grassroots units, and do good deeds and solid work for the masses. Leading cadres should devote at least one-third of their time every year to doing research and investigation work among grassroots units and solve problems for them on the spot. We should advocate the establishment of service centers for grassroots work, acquire the latest information, and ensure direct leadership. Governments at all levels should organize cadres to visit areas where the masses need them most and help solve difficult problems. They should, together with the masses, implement the party's policies and create a new situation. The experience of working among grassroots units will help mold and cultivate our cadres. Organizational workstyle must change dramatic ally. We must be determined to do away with "piles of paperwork and endless meetings," avoid wrangling and prevarication, improve service, and raise work efficiency. In doing things, we should adhere to the spirit of seeking truth from facts, speak unequivocally, work practically, seek practical results, avoid showiness, refrain from riding roughshod over people, and avoid raising a hue and cry. The provincial people's government should, above all, play an exemplary role in the province.

Governments at all levels and their workers should consider themselves as people's servants and voluntarily submit themselves to supervision by the representatives of the people, the people's congresses at all levels and their standing committees. They should faithfully execute resolutions and decisions of the people's congresses and their standing committees, regularly submit work reports, conscientiously handle proposals, suggestions, and criticisms advanced by people's representatives, and see to it every case is attended to.

Fellow deputies!

The task of translating the grand blueprint of our province's Seventh 5-Year Plan into a glorious reality is a very honorable but rather arduous one. However, we have full confidence in victory. Let us, workers, farmers, intellectuals, cadres, PLA commanders and fighters, public security personnel, members of the various democratic parties and people's organizations, Taiwan compatriots, Hong Kong and Macao compatriots, overseas Chinese, and all socialist-motherland-loving people, under the leadership of the CPC Central Committee, the State Council, and the Anhui Provincial CPC Committee, carry forward the spirit of the foolish old man who removed the mountains, engage in arduous struggle, and build the country with hard work and thrift. Let us plunge ourselves into the implementation and realization of the Seventh 5-Year Plan and strive for the accelerated development of Anhui's economy.

PROVINCIAL AFFAIRS

HEBEI REPORT ON 1985, DRAFT 1986 DEVELOPMENT PLAN

SK260745 Shijiazhuang HEBEI RIBAO in Chinese 7 May 86 pp 2, 3

[Report on the implementation of the 1985 economic and social development plan and the draft plan for 1986 economic and social development for Hebei Province delivered by Song Shuhua, chairman of the Hebei Provincial Planning and Economic Commission, at the fourth session of the Sixth Provincial People's Congress on 25 April]

[Text] Fellow deputies:

Entrusted by the provincial government, I now submit a report on the implementation of the 1985 provincial economic and social development plan and the draft plan for the 1986 provincial economic and social development for examination and approval by the present session.

1. The Situation Regarding the Implementation of the 1985 Plan

Thanks to conscientiously implementing the principle of "enlivening the domestic economy and opening to the outside world" and enthusiastically facilitating the reform of the economic, scientific and technological, and educational systems, the situation of the implementation of the 1985 plan for the national economic and social development was very good. The total social product was 73.46 billion yuan (calculated in terms of current prices), an increase of 13.8 percent over 1984. Of this, the total industrial and agricultural output value was 59.43 billion yuan, an increase of 12.1 percent. The output of most of the major industrial and agricultural products met or surpassed their production targets. New progress was made in scientific, educational, cultural, public health, and sports undertakings.

The Province Continued To Reap a Bumper Agricultural Harvest and Made Overall Progress in the Rural Economy

In 1985, the rural areas of our province took a new step toward readjusting the production structure and reforming the system of fixed state purchases of farm produce. This further sparked comprehensive rural economic development. The total social product of the rural areas of our province was 31.09 billion yuan, an increase of 15.1 percent over 1984. The total agricultural output value was 16.46 billion yuan, an increase of 3.3 percent (including the output value realized by the village-run industry). Of this, the output value of forestry, animal husbandry, sideline occupations, and fisheries was 4.34 billion yuan, the proportion of which, in the total agricultural output value, rose from 20.5 percent in 1984 to 26.4 percent. The total grain output was 19.666 million tons, an increase of 5.2 percent over that of the previous year. Due to the planned reduction of cultivated areas and the natural disasters, the total cotton output was 629,000 tons, a drop of 40 percent from the previous year. The total output of oil-bearing crops was 869,000 tons, an increase of 44.8 percent over 1984. The number of large animals in stock at the end of the year was 4.465 million head, an increase of 8.6 percent over that of the previous year. The output of pork, beef, and mutton was 819,000 tons, an increase of 27.6 percent over 1984; that of poultry and eggs was 334,000 tons, an increase of 44 percent; and that of aquatic products was 128,000 tons, an increase of 21.1 percent. In addition, 400,000 hectares were afforested last year, overfulfilling the plan by 50 percent.

Industrial Production Was Developed in a Sustained and Coordinated Manner and Economic Results Were Improved

In 1985, the industrial front of our province persistently attached primary importance to reform; conscientiously popularized the experiences of Shijiazhuang City in applying the method of "collision and rebounce" to carry out reform in a comprehensive and coordinated manner; continued to strengthen and improve the macroeconomic control and management, as well as to further grasp the work of enlivening the enterprises; and enthusiastically and successfully carried out the readjustment of the production structure and product mix. The total industrial output value was 42.97 billion yuan, an increase of 19.7 percent (if the output value realized by the village-level industry is not factored in, the increase was 14.9 percent. Of this, the output value realized by state industrial enterprises increased by 10.7 percent, that realized by the collective industrial enterprises increased by 24.3 percent, that realized by light industrial enterprises increased by 23.1 percent, and that realized by heavy industrial enterprises increased by 16.4 percent. Most of the major industrial products to be appraised according to plans met or surpassed the output targets, except for the fact that a few products such as chemical fertilizer, farm chemicals and sulphuric acid failed to meet their production targets as a result of the changes in supply and demand. The light and heavy industries were developed in a coordinated manner. Of the total industrial output value, the proportion of light industry was 48.5 percent, while that of heavy industry was 51.5 percent. The transportation capacity was improved. The volume of transportation was 5.3 billion ton-km, an increase of 5.5 percent over 1984. The volume of passenger transportation was 5.19 billion person-km, an increase of 8.5 percent over 1984. Postal and telecommunications undertakings witnessed new development, with total transactions of 126 million yuan, 13.9 percent more than in the previous year. The economic benefit of industrial enterprises improved. Compared with the previous year, the output value of local budgetary industrial enterprises grew by 9.9 percent, their income from sales by 15.6 percent, and their profits and taxes by 10.5 percent. The per-capita productivity of state-owned industrial enterprises that exercised independent accounting reached 12,468 yuan, 6.9 more than in the previous year. The overall energy consumption per 100 million yuan of output value of key industrial enterprises declined by 1.4 percent.

Investment in Local Capital Construction Was Brought Under Contro, and Large and Medium-Sized Construction Projects Were Completed Fairly Successfully

In 1985, governments at all levels throughout the province strengthened control over the investment in fixed assets, and straightened things out with regard to the projects under construction. A total of 273 projects were suspended, postponed, or canceled, saving 107 million yuan of investment. The scale of investment in local state-owned capital construction was brought under control effectively. The annual investment in local state-owned capital construction was 1.63 billion yuan, which was 97.3 percent of the state-approved quota in terms of comparable standards. Six large and medium-sized projects--the South Luan He water diversion and supply project, the Wannian No 2 pits in the Fengfeng mining area, the Liannancang vertical pits in the Kailuan mining area, the No 1 200,000-kilowatt power generating equipment included in the Xingtai Power Plant expansion project, the No 1 power generating equipment of Fengrun Power Plant, and the second-phase construction of the coal wharf of the Qinhuangdao Harbor--were completed and put into operation. Investment in technical transformation totaled 1.72 billion yuan. Major projects that were completed and commissioned totaled 1,191, which represented the largest annual figure in recent years.

Channels for Commodity Circulation Increased, and Urban and Rural Markets Became Thriving

In 1985, the total volume of retail commodity sales throughout the province reached 20.44 billion yuan, a 17.5-percent increase over the previous year. The increase was 8.9 percent when price increases are considered. Of this sum, the volume of consumer goods retail sales was 19.97 billion yuan, an increase of 22 percent. The increase of the retail sales of high-grade durable consumer goods, in particular, was even greater, with those of television sets increasing by 87.3 percent, those of electric fans by 2.4 times, those of washing machines by 73.6 percent, those of refrigerators by 6.5 times, and those of recorders by 95.2 percent. With increased circulation channels, urban and rural collective and individual commercial units grew rapidly. Throughout the province, the number of collective and individual commercial units increased to 440,000, 42,000 more than in the previous year, and their employees totaled 1.121 million, 214,000 more than in the previous year. Trade fairs and markets increased to 2,477, an increase of 203 over the previous year, and the business volume of urban and rural trade fairs totaled 3.38 billion yuan, an increase of 45.9 percent.

Revenues Increased Steadily, and the Credit Put Into Circulation Was Properly Controlled

Our province's 1985 revenue plan was fulfilled fairly successfully, with the total revenue reaching 4.515 billion yuan, an increase of 17.2 percent over the previous year. Credit put into circulation by banking units was properly controlled. The province's planned increase in loans to be used as investment in capital construction was 707 million yuan, but the actual increase was 698 million yuan, accounting for 98.7 percent of the plan. The planned increase in the loans of township enterprises was 102 million yuan, and the planned loans of the people's bank to various specialized banks totaled 6.412 billion yuan. Both were fulfilled according to the plans. The headquarters had approved our province's year-end temporary loans to be 1.774 billion yuan, but we actually used 1.754 billion yuan, or 98.8 percent. The amount of money put into circulation was reduced. Under the situation in which the wage and price reforms were initiated, the money put into circulation for the whole year totaled 1.883 billion yuan, a decline of 247 million yuan, or 11.6 percent, from the previous year.

Lateral Economic Ties Were Strengthened, and Foreign Economic Relations and Trade and Technological Exchanges Were Further Expanded

In 1985, our province witnessed new development in lateral economic ties. It sponsored an economic and technological cooperation invitational meeting, the fourth north China cooperation meeting, and a discussion meeting on international economic and technological cooperation and export commodities. All prefectures and cities also adopted various measures to expand lateral economic cooperation. According to incomplete statistics, by the end of last year our province established economic and technological cooperative relations with 27 provinces, municipalities, and autonomous regions and with more than 200 institutions of higher learning and scientific research institutes. During the past year, a total of 4,681 contracts on economic and technological cooperation were signed, with the contract value amounting to 940 million yuan and the materials cooperation value to 520 million yuan. Under these contracts, more than 6,200 competent persons were exchanged. At the same time, our province signed 201 technological import agreements valued at $140 million with foreign countries, almost 2 times that in the previous year, and signed 52 foreign capital utilization agreements valued at $48.03 million, a 2.7-fold increase over the previous year. Foreign trade expanded further. The 1985 total volume of foreign trade and export amounted to $1.298 billion, up 70.3 percent over the previous year. The tourist trade developed steadily. In 1985 the province received a total of 32,000 travellers, including foreign travellers, Overseas Chinese, and compatriots from Hong Kong and Macao, up 45.6 percent over 1984. The foreign exchange income from the tourist trade amounted to $2.23 million, a 38.6-percent increase over the previous year.

In the course of extensively organizing international economic and technological cooperation, we exercised control over the amount of foreign exchange utilized.

Last year, the province used a total of $119.67 million in foreign exchange, accounting for 99.7 percent of the foreign exchange utilization target assigned by the state to our province.

Great Development Was Made in Scientific, Educational, Cultural, Public Health, and Sports Undertakings, and New Achievements Were Scored in Building Socialist Spiritual Civilization

In 1985 our province scored gratifying achievements in research and application of scientific achievements and in technical development. Of the 563 scientific research projects covered by the provincial plan, 477 had met the requirements for progress rate. The research project for the development of the Taihang

Shan and the application of new rural energy resources were commended and awarded by the state. A total of 128 projects, including the project to cultivate grapes rapidly, the Jigeng No 7 drought-resistant variety of crops, the vita series of soft drinks, red and pink grape wine, and optical fiber communications, reached the advanced domestic levels. Among the already-scored scientific and technological achievements, 85.4 percent have been commissioned popularized, or applied.

New headway was made in educational undertakings. In 1985 the local ordinary higher learning institutions enrolled 15,600 students, up 13 prevent over the previous year. Of this, the enrollment in teacher training colleges increased by 19.4 percent, and that of specialized colleges 30.1 percent. The local higher learning institutions readjusted their establishment of specialities; added 46 specialities, such as technological economy, industrial analysis, thermal power engineering, textile engineering, forest protection, livestock and poultry breeding, and feed cultivation; and increased the enrollment quotas for the five specialities which fell short of the demands, such as industrial management, civil engineering, finance and economy, politics and laws, and computer science. Development of adult education was accelerated. Last year, the adult educational institutions enrolled 28,000 students, a 73.8-percent increase over the previous year. The secondary educational institutes enrolled 33,700 students (including the in-service cadres undergoing training), an 8.1-fold increase over the previous year. The enrollment rate of the school-age children reached 97.7 percent. Considerably good results were achieved in the popularization of the 9-year compulsory education and the secondary professional and technical education.

New achievements were scored in the literary, art, press, publishing, broadcasting, television, public health, sports, and family planning undertakings. In 1985 the province produced a total of 13 teleplays involving 23 volumes, distributed 173 new films, and published 447 million copies of newspapers and 239 million copies of books. The medical and public health conditions were continually improved. The number of hospital beds throughout the province reached 103,000, a 4.1-percent increase over the previous year, and the number of full-time medical personnel reached 153,200. The population growth was further controlled. The natural population growth rate was 11.5 per thousand. Our province's athletes won 73 gold medals, 62 silver medals, and 54 bronze medals in various international and domestic sports contests. This was a great breakthrough made by our province in the annals of sports history.

The People's Living Standards Were Improved, and the Growth of Consumption Funds Become Rational

In 1985 incomes of the urban and rural population increased, and their living standards were improved further. The per-capita net income of peasants was 385 yuan, an 11.6-percent increase over the previous year. Adjusting for price increases, the real increase rate was 6.5 percent. The age per-capita daily living expenditures reached 297.6 yuan, a 22.3-percent increase over the previous year. State organs and institutions carried out wage reform, and the enterprises began to readjust wage systems. The per capita wage of staff members and workers was 1,043 yuan, an increase of 13.6 percent over 1984. If the rise in living expenses is not factored in, the real increase was 4.4 percent.

A total of 337,000 jobless people were employed in the urban areas, and the number of workers in the urban areas reached 105,000. The year-end savings deposits of the urban and rural people reached 10.29 billion yuan, an increase of 28.8 percent. The people's housing conditions were further improved. New houses covering an area of 5.6 million square meters of floor space were built in the urban areas while housing projects completed in the rural areas reached about 45 million square meters of floor space. The increase of consumption funds tended to be rationalized on the premise that further improvements were made in the people's living standards.

Viewing from the general situation, the situation of the economic and social development in 1985 was very good. However, there were many problems. With regard to the macroeconomic management, we paid attention to strengthening the control over the scale of capital construction, consumption funds, and the use of credit and foreign exchange. And as a result of the fact that a situation of "demanding uniformity in everything" and exercising excessively rigid control emerged in some fields, some problems demanding an urgent solution were not handled, and some aspects that should have been enlivened were not enlivened at all. With regard to handling the relations between speed and results, we paid attention to maintaining proper speed but failed to take effective measures for upgrading the economic results. Such major problems as low quality, high consumption, poor management, and poor economic results existed in the industrial production and capital construction fields. In the circulation field. there were also such problems as the imbalance between different wholesale links, our failure to bring into full play the role of state and cooperative commercial enterprises as a major channel, lagging behind in terms of management and operation, and the impeded circulation unsuitable to the development of commodity economy. In terms of the rural economic development, we failed to provide the people with appropriate before-, during-, and after-production services. The peasants in some areas lost their enthusiasm for growing grain and cotton; thus, the tendencies of neglecting the farmland capital construction and having farmlands lie waste generally existed. The development of scientific, technological and educational undertakings failed to meet the demands of economic development. We failed to link science and technology with production. Our educational quality was not high enough. The provincial government has taken a series of measures for solving the above-mentioned problems in a step-by-step manner.

2. The Situation of the Arrangement for the 1986 Plan

1) Guiding Ideology and Major Tasks

The general guiding ideology and major tasks of the 1986 economic and social development plan are as follows: Conscientiously implement the guidelines of the Fourth Session of the Sixth NPC; persistently attach primary importance to reform; continue to grasp the reform of the economic, scientific and technological, and educational systems in accordance with the principle of consolidation, digestion, supplement, and improvement; vigorously facilitate lateral economic cooperation; persistently carry out an overall balance between the general demand and the general supply; ensure a sustained, steady and coordinated development of the national economy; continue to readjust the investment structure and the production structure in accordance with the principle of making an overall plan for ensuring the construction of key projects; strengthen key construction projects and technological transformation; enthusiastically increase the production of readily marketable products on the premise of upgrading the quality of product and economic results; maintain a proper economic growth rate; and continue to strengthen the socialist spiritual civilization while grasping the material civilization.

The major targets for the economic and social development are as follows: If calculated based on the 1985 price indices, the total industrial and agricultural output value should be 63.95 billion yuan, an increase of 7.6 percent over 1985. Of this, the total agricultural output value should be 17.12 billion yuan, an increase of 4 percent (including the 7 percent of the output value realized by the industry at or below the village level). The total industrial output value should be 46.83 billion yuan, an increase of 9 percent (excluding the 8 percent of the output value realized by the industry at or below the village level). The national income should be 35.1 billion yuan, an increase of 6.7 percent. The accumulation rate should be 29.5 percent. The per capita net income of peasants should be 420 yuan, an increase of 9 percent. The per capita wage of staff members and workers should be 1,132 yuan, an increase of 8.5 percent. The social labor productivity rate should increase by 4 percent. The overall energy consumption for national income should drop by 3 percent from that of the previous year.

2) Continue To Accelerate the Development of the Rural Commodity Economy

The rural economic development should be based on local resources, and aimed at achieving common prosperity. We should actively perfect the circulation system, and the cooperative service system, and further set to right the position of agriculture in the national economy. While ensuring a steady grain output growth, we should vigorously develop diverse undertakings, and do a good job in the development of "mountainous, coastal, and highland" areas.

In 1986, the output of major farm products is planned as follows: The output of grain is 20 million tons, that of cotton 675,000 tons, that of oil-bearing crops 900,000 tons, and that of meat 900,000 tons. In order to achieve an overall development in the rural economy, we should focus on the following work:

A. We should continue to readjust the rural production structure.

Grain growing areas should be stabilized. This year grain growing areas are planned to be kept at about 4.67 million hectares. We should strengthen management of the 2.46 million hectares of wheatfields, particularly the 1.67 million hectares provided with favorable water conservation conditions, and strive to increase per-unit yields, and the total output. We should stabilize and continuously improve the rural policies in order to protect the peasants' enthusiasm for growing grain and cotton. Localities where conditions permit should adopt measures, such as developing rural industries to support agriculture, or meting out awards or punishment according to the quality of the contracted land, to encourage peasants to invest more in production. Arbitrary occupation of farmland should be strictly banned in order to guarantee the steady growth of grain output. We should strengthen management of cottonfields, and strive to fulfill the state-assigned output plan. We should strengthen management of cottonfields, and strive to fulfill the state-assigned output plan. We should improve purchasing contracts, and organize well the serialized service for production, technology, and circulation. We should pay attention to vegetable production. In line with the guiding ideology of basing on the production of outskirts areas, supplementing it with that of other counties, gearing to the needs of urban areas, and serving Beijing and Tianjin, we should develop, in a planned manner, a vegetable field disposition with outskirts areas as the center, and combining outer suburbs and production bases. We should greatly develop animal husbandry, continuously support specialized households and villages, and expedite the construction of meat, egg and milk production bases, and the development of animal feed industry.

B. We should increase agricultural input, and improve the conditions for production.

We should increase our investment in agricultural capital construction if we are to maintain a steady growth, strengthen the agrotechnological foundation, and increase our strength for agricultural development. The province plans to invest 43.62 million yuan in agriculture this year, a 13.56-percent increase over the last year. At the same time, investment earmarked for some special projects has been arranged through other channels. In addition, rural areas should rely on their own accumulation, and raise funds from various quarters. We should successfully repair the existing agricultural facilities, provide them with all supporting installations, and manage them well. Obstacles in major rivers should be cleared, and their embankment should be reinforced so that rivers can be more capable of flood control. We should do a good job in afforestation and water and soil conservation to facilitate an ecological balance and gradually realize a bening cycle. We should exert more efforts to support poverty-stricken areas, properly use support-the-poor funds and materials, and supply them with sufficient food and clothing. We should also adopt correct policies and measures to invogorate poverty-stricken areas, and help them eliminate poverty and achieve affluence as soon as possible. Arbitrary collection of fees from peasants should be banned in order to lighten the burden on them.

C. We should speed up the development of "mountainous, coastal and highland" areas.

In mountainous areas, measures corresponding to local conditions should be adopted to fully develop local resources, expand farming, forestry, animal husbandry, and sideline production persistently in an all-round manner, engage in agriculture, industry, commerce and transportation in a comprehensive manner, and greatly develop the commodity economy. We should pay attention to planting trees and grass to conserve water and soil.

In highland areas, we should implement the principle of "combining forestry, grass planting, animal husbandry, and farming, with the focus on animal husbandry, while developing industry and commerce," strengthen the construction of grassland and shelterbelts, accelerate grassland renovation and its rational utilization, change grazing-land to increase grassland fertility, develop the three major advantages in animal husbandry, sesame production, and potato production, do a good job in the processing of animal products, and further improve the overall economic results.

Coastal areas should focus on fisheries, give priority to the production of marine products and salt, and the development of coastal strip, make the best use of sea and beach resources, actively develop sea fishery and aquaculture, and correspondingly develop supporting breeding fry, bait material, processing, storage, and road facilities.

D. We should accelerate the construction of commodity production bases.

In accordance with the principle of carrying out the unified plan in a step-by-step manner, this year we must concentrate on the construction of the corn production bases in the eastern part of the province, the Heilonggang cotton production base, vegetable production bases, livestock production bases, and fruit production bases. With regard to the construction of corn production bases, we should concentrate on making an overall plan, providing coordinated service, and conducting economic appraisal. With regard to the construction of cotton production bases, we should focus on breeding fine seeds, spreading technology, and constructing infrastructural facilities. With regard to the construction of quality cotton production base counties, this year we should grasp the construction of 11 base counties of such kind, including Nangong, Gucheng, and Jixian counties. With regard to the construction of vegetable production base counties, we should pay attention to the construction of nine base counties of such kind in Zhangjiakou, Langfang and Baoding prefectures which are near Beijing and Tianjin. With regard to the construction of livestock production base counties, this year we should grasp the construction of seven base counties for raising lean-meat hogs, six base counties for raising meat cattle, and two freshwater fish breeding bases in Tangshan and Shijiazhuang cities. With regard to the construction of fruit production bases, this year we should concentrate on building a production base of Xuehua pears in Zhaoxian County and a production base of honey peaches in Shenxian County. In accordance with the market demands and individual advantages, all localities should strive to achieve the construction of small bases for the production of meat, eggs, milk, vegetables, melons, fruits, medicinal materials, and flowers and plants.

E. We should accelerate the development of town and township enterprises.

We should enthusiastically support and vigorously develop town and township enterprises. In accordance with the market demands and different actual conditions, all localities should make the most of their own advantages and natural resources to take a path of organizing industrial and agricultural production in accordance with the demands of foreign trade. We should achieve the precision processing of farm and sideline products and pay attention to developing the tertiary industry. In accordance with the regulations set forth in the state policies, the areas with mineral resources should enthusiastically develop mining and building materials industries and various kinds of service trades. The areas around the urban areas and with fairly developed economy should develop the processing industries to serve large industrial enterprises or export trade. The town and township enterprises that have made an early start and with a good economic foundation should upgrade and update their products, carry out technological transformation, strive to develop new products, upgrade the product quality, and strengthen their competitiveness. We should continue to give assistance to the town and township enterprises, in particular, those in mountainous areas and highlands that have made a late start and have no good economic foundation. The urban industrial enterprises should enthusiastically expand the sales of their products to the rural areas, help the rural areas cultivate talented persons, offer them technologies, and provide information to them so as to expand the economic and technological cooperation between the urban and rural areas. While vigorously developing township- and village-run collective enterprises, all localities should enthusiastically support the development of cooperative enterprises and household-based enterprises in an effort to ensure that these four kinds of enterprises will be developed coordinately. The total income of the town and township enterprises this year is planned to be 20 billion yuan, an increase of 19.8 percent over 1984.

3) We Should Keep a Proper Industrial Growth Rate on the Premise of Upgrading the Economic Results.

With regard to the industrial production, this year your province should attach primary importance to reform, vigorously facilitate lateral economic cooperation, accelerate the pace of technological transformation, continue to readjust production structure, consciously strengthen enterprise management, and ensure a proper industrial growth rate on the premise of upgrading the economic results.

A. Further enhance the vitality of the enterprises.

We should continue to streamline administrative procedures and delegate power to the lower levels, and implement the regulations of the state and provincial policies on enlivening the enterprises. While enlivening the large and medium-sized enterprises, we should further relax the policy restrictions and enliven the small state enterprises and collective enterprises by carrying out the methods of managing the enterprises on a contract or lease basis, delegating power to them, and collecting funds for running these kinds of enterprises. In accordance with the state regulations, we should do a good job in reducing the regulatory business taxation of the enterprises and in allowing them to be exempted from it, and should increase the depreciation funds in a step-by-step and planned manner. This year, the province taxation totaling 61.92 million yuan for large and medium-sized enterprises in order to enhance their vitality. We should continue to expand the enterprises' plan-making power. The number of products covered by the provincial management plan decreased from 91 in 1984 to 83 this year. When assigning mandatory planning to the enterprises, we should leave some margin. We should initiatively carry out the system of factory heads taking the responsibility and fixing targets during their terms of office, and improve various categories of economic contract responsibility systems. The enterprises with favorable conditions are allowed to divide various accounting units and to carry out the system of each level taking the responsibility for managing the divided work. Through reform, we should ensure that the enterprises will be able to upgrade their abilities in accumulation, transformation and development.

B. We should accelerate the technological transformation of enterprises. This year the state will provide the province with 837 million yuan of investment in technological transformation projects. This investment will be mainly made in the light and textile, energy, raw materials, machinery, and electronics industries. Through reform, readjusting the product mix, improving the quality of products, and accelerating the upgrading and updating of products, we will gradually change the situation in which our products have remained at the same level for many years in terms of quality and have lacked competitiveness. We should continue to grasp technological transformation and emphatically import key equipment and software technologies. At the same time, we should strengthen the digestion and application of the imported technologies, and constantly raise the ability to develop new products and blaze new trails and the level of domesticization.

C. We should vigorously promote lateral economic cooperation. We should further expand the economic and technological ties with various fraternal provinces, municipalities, and autonomous regions, and gradually establish an open economic network. We should give full play to the role of the central cities, and strengthen the economic ties between the urban and rural areas. We should actively establish lateral economic ties between various enterprises, focusing on the brand-name, better-quality, and readily marketable products. Those integrations which have already been established should be consolidated and improved constantly in order to gradually develop them into group enterprises. We should strengthen the guidances over, coordination of and service for the lateral economic integrations, transmit information to them in a timely manner, and give them support in all fields. We should successfully hold the international and domestic economic and technological trade talks, positively utilize the foreign capital, and further expand the economic and technological exchanges with foreign countries and with other provinces in our country.

D. We should actually strengthen the enterprise management. Centering on improving the quality of products and lowering the materials consumption, we should actually strengthen and improve the enterprise operation and management, and comprehensively improve the quality of enterprises. Beginning with the basic work, we should attend to the work in the fields of standardization, metrological examination, management of production quota, information network, rules and regulations, basic education, and building of teams and groups. We should focus on popularizing the overall quality management and the overall economic accounting in order to make the stability and improvement rate of major products reach 80 percent or higher, to lower the raw materials consumption, calculating in terms of the materials volume, by 3 percent from the previous year, and to reduce the deficits of the money-losing enterprises by 25 percent. We should positively popularize the modernized management methods, gradually change the traditional management methods, and constantly improve the management of enterprises.

4) We Should Strictly Control Investment in Fixed Assets and Rationally Readjust the Investment Structure.

This year the initially arranged state investment in the province's fixed assets is 1.76 billion yuan, of which, 923 million yuan will be invested in capital construction projects, and 837 million yuan in technological transformation projects. Of the investment in capital construction, 220 million yuan is the investment raised by the localities in a unified manner and covered by the state budget; 360 million yuan is the investment raised by the people privately; 270 million yuan is the investment earmarked for rebuilding Tangshan, which was hit by an earthquake; and 73 million yuan will be invested in other projects. Calculating in terms of comparable standards, this figure is 175 million yuan less than that in the previous year. This investment will be mainly used for agriculture, energy industry, transport, communication, light and textile industries, raw materials industry and intellectual development. Of the 220 million yuan of investment raised by the localities in a unified manner, investment in agriculture will be 43.62 million yuan, up 13.56 percent over the past year; and that in education, 28.79 million yuan, up 27 percent. In addition, the province will invest the 90 million yuan, which is from the retained portion of the above-quota funds collected for developing key energy and communications projects, in energy and communications projects, an increase of 20.8 percent over the past year. In readjusting the investment structure, we will appropriately reduce the non-productive construction projects, and the proportion of the investment in such projects will drop from 69.8 percent in the past year to 54.8 percent. The key projects which will be completed and commissioned this year include: the Huabei Oilfield (700,000 tons); the Douhe Power Plant (200,000-kw generating unit); the Xingtai Power Plant; (200,000-kw generating unit); the Tangshan Power Plant (50,000-kw generating unit); the Zhangcun Colliery (300,000 tons), the Fengrun Power Plant (50,000-kw generating unit); the 500,000-volt high tension power transmission and transformation project from Shentou to Tianjin via Datong and Beijing, the Tangshan Coking and Gas Manufacturing Plant, the float glass production line of the Qinghuangdao Yaohua Glass Plant; the provincial scientific academy; the provincial scientific and technological building; the provincial scientific and technological information center; a library; the traditional Chinese medical college; and a genetic breeding center. Major projects to be continued or started according to plans include the Kailuan mining areas, the Fengfeng mining area, the Xingtai mining area, the Handan mining area, the Xingtai Power Plant, the Shangan Power Plant, the Shalingzi Power Plant, the Xiahuayuan Power Plant, the Baoding Power Plant, the Handan Power Plant, the Panjiakou energy reservation power station, the Tangshan Steel Plant, the Handan Steel Plant, the Xuanhua Steel Plant, the Chengde Steel Plant, the Bangmoshan Iron Ore in Qianan, the Tangshan Soda Plant, the Qinhuangdao Phosphate Ammonium Plant, the Daqian Railway, the Shijiazhuang railway pivot, the Handan south station, the expansion of the coal wharf of the Qinhuangdao harbor, the Shacheng-Donghuishe highway, the Shijiazhuang Oil Refinery, the Shijiazhuang Kinescope Plant, the Children Hospital, the Tumor Hospital, and the construction of some colleges and universities, and some agricultural, animal husbandry, and fishery commodity bases.

We should continue to implement the relevant regulations of the State Council and the provincial government in order to effectively control the investment scale. With regard to the key projects decided on by the state and the province, we should strengthen leadership and management, coordinate and solve the problems emerging in the course of construction in a timely manner, strictly act according to capital construction procedures, and conscientiously institute the system of taking the responsibility for the entire course of construction so that the projects can be completed and put into operation according to plans, and yield faster results. Meanwhile, we should make good early-stage preparations for all projects, and actively reserve some projects.

5) Enliven Circulation, and Expand Domestic and Foreign Trade

This year we should continue to reform the circulation system, vigorously establish, on a trial basis, new commercial units which combine industrial units with commercial ones, agricultural units with commercial ones, or agricultural, industrial units and commercial ones, expand commodity exchanges between the province and other provinces, and between urban and rural areas, invigorate fund circulation, and stimulate the development of the commodity economy. In 1986, the volume of commodity retail sales is planned to reach 23.44 billion yuan, an increase of 14.7 percent over last year; and that of exports is planned at $1.338 billion, an increase of 3.1 percent. This year, priority should be given to the folloiwing work:

A. We should open side the doors of urban and rural areas, and strive to open up a great market for the commodity economy. We should orient our work toward the rural areas and the whole country, serve Beijing and Tianjin, expand purchasing and marketing, encourage competition, make markets flourish, and ensure supply.

B. We should give play to the role of state-owned and cooperative commercial units as main channels, and make meticulous arrangements for markets. We should actively organize goods supply, increase the supply of industrial consumer goods, minor commodities and nonstaple foods, pay particular attention to the supply of vegetables, meat and eggs to cities and industrial and mining areas, participate in market regulation, and stabilize market prices.

C. We should speed up the construction of trade centers of means of production. We should encourage enterprises in and outside the province to take part in the markets of means of production, to make up for the others' deficiency from their own surplus, and to exhange information. Supply departments at all levels should render great support, extend quality service, and enliven material circulation.

D. We should accelerate the development of the tertiary industry. We should greatly develop catering, service, and repair trades by pooling the efforts of the state, the collective, and the individual, and the efforts of industrial and agricultural departments.

E. We should expand foreign trade and export, and increase foreign exchange earnings. Major products to be exported this year include 500,000 tons of corn, 50,000 tons of cotton, 90,000 pieces of cotton yarn, and 125 million meters of pure cotton cloth. All of them showed increases over last year. We should conscientiously carry out the state's various preferential policies aiming at promoting the production of export-oriented goods, and encourage enterprises to expand exports in order to earn more foreign exchange. While exporting traditional goods, and staple key commodities, we should also focus on the export of mechanical and electronics products. We should consolidate the old markets, and open up new ones. We should vigorously develop tourism, and do a good job in labor service export to earn more foreign exchange.

6) Reform the System of Science and Technology and Facilitate Technological Progress.

This year we should continue the reform of the scientific and technological system, carry out scientific research on the five trades of agriculture, light industry, textile industry, machinery and electronic industry, and chemical industry, and the four spheres of computer technology, bioengineering, new materials, and energy technology with the research on application, development and technology as the major tasks, develop the technology and tackle the technical problems of 24 major projects, and popularize and apply the 100 scientific and technological achievements. Major measures are as follows:

A. We should vigorously facilitate the reform of the scientific and technological system. We should widely open up technological markets to accelerate the circulation of technological commodities and improve the system of developing technologies in the rural areas and provide them with technological service in order to promote the readjustment of the production structure and the development of the commodity economy. Enterprises should be encouraged to set up institutions in charge of technological developments in order to ceaselessly enhance their ability to absorb technology and achieve development. Enterprises should be encouraged to establish technological cooperation ties with universities, colleges, and scientific research and designing units. Scientific research units should further carry out the self-management system, continue to carry out the system of signing contracts with payment linked to the technologies provided and the system of undertaking tasks on a contract basis. Prefectures, cities, and relevant departments should bring their roles into full play by carrying out a system of each level undertaking the assigned tasks.

B. We should conscientiously carry out the "speak plan." Small and medium-sized enterprises, town and township enterprises, and the vast rural areas should organize forces and cooperate with each other to select and develop a group of "the items that can achieve faster results with less investment" in order to set "a prairie ablaze" to promote our province's economic development.

C. We should vigorously popularize and apply the existing scientific and technological results. We should organize forces to compile, sort out, coordinate, and classify the existing scientific and technological results; and focus on expanding and transferring these results to small- and medium-sized enterprises and town and township enterprises.

D. We should organize forces to tackle scientific and technological problems. Relevant scientific research, teaching and production units should be organized to select items and cooperate with each other to tackle scientific and technological problems.

7) We Should Reform the Educational System To Upgrade the Educational Quality.

This year, we must continue to carry out the reform of the educational system, strengthen elementary education, make the 9-year compulsory education universal in a planned and step-by-step manner, vigorously develop teachers training education, readjust the secondary educational structure, develop vocational and technical education, and strive to upgrade the educational quality. In

1986, ordinary institutions of higher learning plan to recruit 16,380 students, an increase of 5 percent over 1985; secondary specialized schools plan to recruit 32,790 students, an increase of 15.3 percent; adult higher educational schools plan to recruit 32,768 students, an increase of 14 percent; ordinary middle schools plan to recruit 904,600 students, an increase of 3.4 percent; agricultural vocational middle schools plan to recruit 50,000 students, an increase of 13.8 percent; and primary schools plan to 1.17 million students, an increase of 7.2 percent. This year, we must concentrate on the following few tasks:

A. We should strengthen elementary education. First of all, we must grasp the work of making primary school education universal in order to lay a good foundation for making the 9-year compulsory education universal.

B. We should strengthen the construction of the ranks of teachers. The existing teachers training schools should enhance their teachers' quality and improve their conditions for running schools. In accordance with the principle of the province taking charge of cultivating teachers for senior high schools, prefectures and cities taking charge of cultivating teachers for middle schools and key primary schools, and counties (cities) taking charge of cultivating teachers for primary schools and nursery schools, we should perfect the system of developing teachers training education, do a good job in running educational institutions and county-level teachers training schools, organize teachers to attend advanced courses and upgrade their knowledge in a planned manner, and upgrade their teaching ability.

C. We should accelerate the development of vocational middle schools. While continuing to develop ordinary senior schools, we should vigorously develop vocational and technical education. Counties in the "mountainous and coastal areas and highlands" and Heilongjiang area should establish vocational middle schools in a step-by-step manner. In order to promote the development of vocational middle schools, from now on, we should give priority to recruiting workers from among the graduates of vocational middle schools.

D. We should strengthen higher educational work. We should tap the potential of the existing institutions of higher learning, expand the quotas for enrollment, and upgrade the educational quality. We should further readjust specialized establishments and accelerate the development of the branches of learning that we are short of, that we have not had, and that we are weak in.

E. We should strengthen the management of adult education. On the basis of consolidation and improvement, we should gradually shift the focal point of adult education to vocational education in order to cultivate more and better talented persons.

8) New Development Should Be Achieved in Culture, Health, and Sports.

Literature, art, press, publication, broadcasting, film, television, cultural and historical sites, museums, and other cultural undertakings should persistently serve the needs of the people and socialism, give top priority to social benefit, and provide more and better intellectual products to the people. We should actively develop public health, strengthen the construction of key hospitals, make rural health work successful, exert great efforts to train health perosnnel, strive to control and reduce the incidence of major diseases, and improve the people's health. Family planning should be continued to bring the natural population growth down to 11 per thousand. We should further carry out urban and rural sports activities, strive to raise the technical level of specialized sports teams, and enable them to achieve better results at major domestic and international events.

9) Make Proper Arrangements for the People's Lives

The living standards of the people in urban and rural areas should be continuously improved on the basis of developed production. We should conscientiously pay attention to the production of daily consumer goods, and nonstaple foods, such as vegetables, meat, and eggs, and organize market supply well. We should accelerate the development of the tertiary industry to achieve broader employment. We should also solve the conspicuous problems left over by the wage reform, and readjust the wage differences among different categories of jobs in some localities. Commodity prices should be kept practically stable. This year, the rise of the retail price index should be kept resolutely under 5 percent in the province, and arbitrary price hikes for the purpose of a huge profit should be stopped. We should continue to improve the housing conditions of urban people, actively develop social welfare undertakings, and make a success of relief work and special care to disabled servicemen and to family members of revolutionary martyrs and servicemen.

10) Continue To Improve the Planning System and Strengthen and Improve Macroeconomic Control

In order to meet the requirement of the socialist planned commodity economy, we should further reform the planning system, properly reduce the proportion of mandatory plans, and expand the scales of guidance plans and market regulation. The mandatory targets assigned to some large and medium-sized state-owned enterprises this year have allowed the enterprises about a 10-percent margin of production capacity. No level is permitted to increase the quotas, and those who assign the targets should be responsible for the balancing and coordination of major production conditions. Enterprises responsible for the allocation and distribution of the products covered by mandatory plans should receive orders for goods in strict accordance with plans, and organize production in line with required varieties, specifications, and schedules.

According to the state's relevant regulations, all construction projects, except for those of primary and middle schools, nurseries and kindergartens, and teachers training institutions built with flexible financial resources or extra-budgetary funds, should be included in plans, and be controlled and managed in a planned manner.

In order to gradually change from the mainly direct into the mainly indirect control in the macroeconomy, we should implement economic rules and regulations, establish and improve economic regulatory organizations, utilize economic levers in a comprehensive manner, strengthen macroeconomic control and regulating methods, do a good job in economic information and economic forecasting, establish an information network, and continue economic analyses and studies of input, output, and quantity to serve production, construction, and the enlivened economy.

This year is the first year of the Seventh 5-Year Plan period. The present situation is very good, and yet the tasks are very arduous. We should unite with and rely on the forces of various quarters, carry forward the spirit of working hard and building the country through thrift, work in unison, pool the wisdom and efforts of everyone, carry out reform persistently, explore to make advances, work diligently and in a down-to-earth manner, study new situations continuously, solve new problems, and strive to fulfill this year's tasks.

ECONOMIC DEVELOPMENT ZONES

BRIEFS

SHANGHAI POWER EQUIPMENT CORPORATION--Shanghai--The founding of the Shanghai Economic Zone Power Transmission & Distribution Equipment Corporation (STDC) was announced here yesterday. The STDC consists of the main manufacturers, research and design institutes in the field within the Shanghai Economic Zone, said manager of the corporation Shi Zuming at the opening ceremony. "The STDC is an integrated economic complex engaged in research, design and manufacturing of complete sets of power transmission and distribution equipment," Shi said. "The corporation was set up in a bid to solve the lack of coordination of research, manufacture and distribution of equipment in the region, and to suit the development of the economy," he added. ANHUI GOVERNOR ATTENDS HEFEI ECONOMIC MEETING

OW021303 Hefei Anhui Provincial Service in Mandarin 1000 GMT 31 May 86

[Excerpts] A provincial conference on economic restructuring opened in Hefei today. Attending the conference are provincial party and government leaders including Wang Yuzhao, Lu Rongjing, Meng Fulin, (Han Danqin), Kang Zhijie, (Guo Qixiang), Zhang Dawei (Dao Ming), Wang Houhong, Song Ming, Zheng Jiaqi, (Yang Zhengyi), and (Zhao Huaihou).

After briefing the meeting participants on the main points of Premier Zhao Ziyang's speech at the first national conference on economic restructuring in urban areas held last March in Beijing, Vice Governor Zhang Dawei outlined seven measures to further promote lateral economic association in Anhui:

1. Lateral economic associations should be promoted as the main form of economic cooperation among enterprises.

2. In promoting lateral economic associations among enterprises, it is necessary to adhere to party policies.

3. The purpose of lateral economic associations is to rationalize the country's economic and industrial structure with a view to promoting production and voluntary cooperation on the basis of mutual benefit among enterprises.

4. In promoting lateral economic associations, it is necessary to broaden the decision-making powers of enterprises. It is necessary to formulate a series of policies to encourage lateral economic associations.

5. It is necessary to revitalize enterprises through lateral economic associations, and to create favorable conditions for the reform of enterprises.

6. In promoting lateral economic associations, we should aim at accelerating the replacement of the old structure by a new one.

7. It is necessary to deal correctly with problems encountered in the course of carrying out reform and invigorating the economy. We should never seek simplified methods of solution.

Representatives of prefectures, cities, and counties and leaders of provincial departments concerned also attended the conference.

FUJIAN'S HU PING STRESSES SCIENCE, TECHNOLOGY

OW090833 Fuzhou FUJIAN RIBAO in Chinese 16 May 86 p 2

[Text] In his report to the Fifth Session of the Sixth Fujian Provincial People's Congress, Governor Hu Ping pointed out: Scientific and technological progress and the development of intellectual resources are strategically important to national economic growth; they are the preconditions for economic revitalization and the four modernizations. We must rely on science and technology to achieve national economic growth during the Seventh 5-Year Plan. Scientific and technological work should be conducted in a way that will best serve the purpose of economic and social development.

Hu Ping said: During the Seventh 5-Year Plan, we should undertake a number of projects that require less research time and are more reliable and capable of producing quick results. While actively applying and disseminating research results, we should also step up basic research as well as mid- and long-term research in those applied sciences that may contribute to Fujian's economic development. First, we should strengthen applied research to make full use of the advantages of our mountains and seas. We should firmly implement the "sparking program" to raise the technological standards of our medium-sized and small enterprises, rural enterprises, and farm production. Second, we should do a good job of digesting, absorbing, and improving imported technologies, successfully carry out technological transformation of enterprises, and quickly turn science and technology into productive forces to meet the needs of our opening to the outside world and developing lateral economic ties. Third, we should organize coordinated efforts to tackle major research and technical problems encountered in economic construction and social development. To ensure scientific and technological development, we need to further reform our scientific and technological structure, raise our research institutions' ability to conduct research and develop new technologies, popularize the remunerative contract system, expand the technology market, vigorously promote joint economic ventures for technological development and unclog circulation channels to ensure the smooth flow of research results to the production sector. We should speed up scientific and technological personnel training, expand their ranks, institute a system of hiring people for specialized technological posts, and further arouse the initiative of the vast numbers of scientists and technicians.

Hu Ping said: Education should center on personnel training and the development of intellectual resources. It should serve to raise the ideological, cultural, and technological standards of our people. During the Seventh 5-Year Plan, we should comprehensively implement the central committee's decision on reforming the education structure, enforce the Law of Compulsory Education of the People's Republic of China, seriously strengthen preliminary education, actively push forward the 9-year compulsory education system, make primary education universal, vigorously develop middle school education, improve secondary vocational and technical education while promoting regular high school education, and pay attention to the development of preschool education. Regular high schools should readjust their curriculums, improve their teaching infrastructure, and raise educational standards. We should vigorously develop adult education and initially establish an adult education system incorporating primary, secondary, and higher education. We should make serious efforts to run schools for training teachers at all levels. We should give priority to teachers' education in terms of budgeting and other conditions. We should foster fine social ethics of respecting teachers and knowledge and help to establish a contingent of teachers suitable to our needs in terms of standards, numbers, and specialization. Schools of all kinds and at all levels should implement the policy of development in an all-round way, morally, intellectually, artistically, and physically. We must pay attention to the quality of education in order to train qualified personnel for socialist construction.

Hu Ping said: To ensure vigorous development of science, technology, and education, budgets for and investment in these two areas will increase during the Seventh 5-Year Plan. Governments, departments, enterprises, collectives, and individuals should all concern themselves with science, technology, and education and fulfill their obligations to help promote their development.

HUBEI'S GUO ZHENQIAN ON COMMODITY CIRCULATION, CREDIT FUNDS

HK310153 Wuhan Hubei Provincial Service in Mandarin 1000 GMT 28 May 86

[Text] In his speech at the provincial conference on financial and trade work which concluded today, Governor Guo Zhenqian stressed: Enlivening the circulating of commodities and making good use of credit funds are two difficult points and two focal points of the current financial and trade work. CPC committees and governments at all levels must do well in grasping them.

In dealing with the work of enlivening the circulation of commodities, Guo Zhenqian said: After the control of the price of the live pigs was lifted, the majority of some 800 food business centers have found it hard to do business and have incurred serious losses. However, one-third of the food business centers have been able to ensure no losses incurred and some county food companies have made profits. The main reason is that these enterprises have carried out their internal reform relatively well and have suited the new situation. To overcome the difficulties now encountered by state-run commercial enterprises and supply and marketing cooperatives in doing business, it is therefore first to begin with enterprises' internal reform. Second, it is essential to break through the demarcation line of departments and regions, to vigorously develop many forms of economic ties, and to form a new type of enterprises and a network of circulation. It is imperative to vigorously implement the agent system and to sell products on behalf of factories and peasants. In the past, Hankou had many bazaars, which were agents. This mode of operation can now be used.

In talking about making good use of funds, Guo Zhenqian said: Our province is now still slightly short of funds. Party and government leaders at all levels and economic departments must regard making good use of funds as an important matter and strengthen the management of funds and guidance to and supervision of their application.

JILIN PARTY LEADERS HOLD ECONOMIC FORUM

SK010447 Changchun Jilin Provincial Service in Mandarin 2100 GMT 30 May 86

[Text] On the afternoon of 30 May, leading comrades, including Gao Di, secretary of the provincial CPC Committee; Gao Dezhan, governor; and Gao Wen and Liu Shulin, vice governors, held informal discussions with responsible comrades of various cities, prefectures, and autonomous prefectures who were attending the provincial economic work conference and the provincial economic structural reform work conference, and heard their briefings.

Gao Di, secretary of the provincial CPC Committee, gave a speech on strengthening economic and ideological and political work. Comrade Gao Di pointed out: It is necessary to further strengthen leadership over economic work. Recently, the provincial CPC Committee and government called for focusing attention on the following tasks: In agriculture, we should combat disasters in order to reap a bumper harvest. We should overcome low temperatures, cold weather, and insect pests, and strive by all possible means to prevent flooding. At present, the work of transplanting rice seedlings has been basically completed. The focus of economic work in the days to come should be on grasping industry, and the major tasks in the industrial sector should be on reform. The basic principles for reform are to open the province to the outside world and to invigorate the domestic economy. We should display the superiority of natural resources and guard against the closed economy. We should not depend on a locality or an enterprise to solve our problems. It is necessary to establish cooperation and gather the superior aspects from all fields in order to boost production and increase economic results. We should emancipate our thinking and eliminate the ideology of fearing other people picking up our good things. Cooperation is aimed at developing mutual benefits. Even though we have favorable conditions for running enterprises, we should also break through barriers to engage in extensive development. We should extensively carry out multilayered and multichanneled cooperation in various forms. In cooperation, we should allow enterprises to enjoy more decision-making power and should ease rigid control over them. The main job of the leading organs is to render better service. All enterprises should firmly implement the economic contract responsibility system at all levels, and properly handle the relations of interests among the state, the collective, and the individuals. After the implementation of policies, enterprises should guarantee their success with scientific management so that their managerial level will meet the requirements of economic reform.

In his speech, Comrade Gao Di emphatically pointed out: In the course of reform, we should strengthen ideological and political work, for this is the fundamental guarantee for fulfilling all our tasks. It is necessary to unswervingly implement the system of plant directors assuming full responsibility. The CPC committees should support plant directors and should not meddle in their administrative affairs. They should grasp major policies, ideological and political work, and the building of the party. They should also improve party style. We should exert joint efforts to run enterprises in a better manner and to make greater contributions to the state.

The forum was attended by the responsible comrades of the provincial CPC Committee and government; the various departments, commissions, offices, and bureaus; and the provincial foreign affairs office.

NEI MONGGOL'S BU HE ADDRESSES SUPPLY, MARKETING CONFERENCE

SK091206 Hohhot Nei Monggol Regional Service in Mandarin 2200 GMT 8 Jun 86

[Text] At the recent regional supply and marketing cooperatives work conference, Bu He, chairman of the regional government, said: In the course of reforming the structure of the supply and marketing cooperatives, we should extensively carry out lateral economic cooperation on the basis of changing them from being owned by the government to being run by the people, and serve the peasants and herdsmen in developing commodity production.

The 6-day regional supply and marketing cooperatives work conference summed up the experiences of the supply and marketing cooperatives across the region gained since the unfolding of structural reform and studied the work for the second half of the year. Comrade Bu He has been concerned about the structural reform work of the supply and marketing cooperatives. He fully affirmed the achievements in the previous stage of structural reform of the supply and marketing cooperatives and put forward specific demands on future work. Bu He said: Recently, we have decentralized some rural supply and marketing cooperatives. We should conscientiously sum up experiences in decentralizing the supply and marketing cooperatives and better balance their relations. At present, we will not decentralize any additional supply and marketing cooperatives. Reform is a process of exploration and practice. We should not seek uniformity.

Comrade Bu He said: Turning some government-run supply and marketing cooperatives into civilian-run cooperatives and increasing the number of supply and marketing cooperatives are beneficial to establishing close ties between the supply and marketing cooperatives and the peasants and herdsmen and winning support from the masses. Peasants and herdsmen said joyfully that their supply and marketing cooperatives have come back. Under the situation in which the commodity economy is being developed, about 60 percent of the supply and marketing cooperatives in the market sphere have more obviously displayed their role as the major channels.

Comrade Bu He called on the CPC committees and governments at all levels to strengthen leadership over the supply and marketing cooperatives, support their work, delegate powers to them, and help them solve difficulties. As for the outlaying poverty-stricken areas, we should realistically implement the policy on nationalities and support them economically. With regard to a small number of low-profit and money-losing enterprises, the relevant departments should try all possible means to support them, to help them free themselves from poverty, and to vitalize them within a short period of time so that they will be able to better serve peasants and herdsmen.

While touching on lateral cooperation, Comrade Bu He called on the supply and marketing cooperatives with appropriate conditions to carry out cooperation between farming and commercial units, between livestock breeding units and commercial units, and between industrial and commercial units, and among commercial units. On the one hand, the supply and marketing cooperatives should sign cooperative operation contracts with peasants and herdsmen and provide them with serialized preproduction and postproduction services. On the other hand, they should promote the sales of farm, animal, native, and sideline products to other localities. At the same time, they should actively raise funds to run all kinds of cooperative processing industrial units in order to turn out intensive processing products on the spot.

He expressed the hope that the supply and marketing cooperatives will make great contributions to developing commodity production, establishing township enterprises, and helping the poor.

While touching on democratic management over the supply and marketing cooperatives, Comrade Bu He pointed out: Those peasant and herdsmen representatives who participated in the board of directors and the supervisroy committee should not only give guidance in the work but should also speak prudently and realistically represent the interests and demands of peasants and herdsmen.

With regard to the improvement among supply and marketing cooperatives, Comrade Bu He called for efforts to raise the political awareness and the professional skills of the workers and staff. He expressed the hope that workers of the supply and marketing cooperatives will cherish their own work and improve service quality. He suggested that in the future, the educational departments, should transfer some college and secondary vocational school graduates to work in supply and marketing departments. They will receive the same wages as cadres of state organs.

At the conference, Comrade Bu He also put forward some suggestions on the current purchases of fine hair and the development of cooperation between plants and the raw materials producing bases, which greatly inspired the comrades attending the conference.

BRIEFS

MATERIAL SUPPLY WORK REFORMS--According to HUNAN RIBAO, Governor Xiong Qingquan said at a provincial conference on material supply work on 7 June that a current important task in the province's material supply work is to reform the materials planning setup, achieve comprehensive balance in materials, further develop the production materials market, and enliven the circulation of materials. At present the planning and allocation of major materials is under the charge of the provincial planning commission. The connection between these arrangements and actual operations is not tight enough. As a result there is a lack of coordination between what is covered by the plan and what is not, between allocation and supply, and between operations and management. To solve this problem, Governor Xiong demanded that a good grasp be got of reforming the material planning and allocation setup and that proper comprehensive balance of materials be organized. The material supply bureaus must help the planning commissions to tackle this work. [Excerpt] [Changsha Hunan Provincial Service in Mandarin 2200 GMT 9 Jun 86 HK] /9738

FINANCE AND BANKING

'READER'S MAILBOX' ANSWERS QUESTIONS ON JOINT VENTURES

HK120314 Beijing ZHONGGUO XINWEN SHE in Chinese 0248 GMT 7 Apr 86

[Readers' Mailbox: "How Can Enterprises Run With Overseas Chinese Capital and Foreign Capital and Chinese-Foreign Joint Ventures Acquire Loans?"]

[Text] Beijing, 7 Apr (ZHONGGUO XINWEN SHE)--Question: What is done if an enterprise run with overseas Chinese capital or foreign capital or a Chinese-foreign joint venture wants to acquire a loan?

Answer: Any enterprise with monopolized capital or joint venture which has been approved by China's relevant departments and has registered at the state industrial and commercial administrative bureau and acquired a license for operation may apply for loans at the local Bank of China.

The Bank of China now handles such loans in the following categories: First, loans for circulating funds, namely, loans for short-term circulating funds which enterprises are short of in the process of commodity production and commodity circulation; second, loans for settling accounts, which an enterprise needs for the production funds which have been spent on the shipment of commodities in the course of their marketing in China and abroad; and third, loans for fixed assets, namely, funds needed by an enterprise to expand professional operations, for renovation and transformation, and for the increase of fixed assets.

These loans are made either in Renminbi or foreign currencies. The enterprise will repay the loan in the kind of currency it borrows, and interest will be calculated in terms of the kind of currency involved.

Question: What is the procedure for applying for a loan?

Answer: In applying for such loans, one must first meet the following requirements: First, the applicant must observe the "Law of the People's Republic of China on Joint Ventures Using Chinese and Foreign Investment"; second, the applicant must have an account at the Bank of China or a bank approved by the Bank of China; third, it must have a reliable reputation and good management and operations; and fourth, it must have reliable sources of funds for loan repayment and interest payment, and a mortgage or a guarantor unit approved by the bank must be provided when an application for a loan is made.

An enterprise must meet the foregoing conditions with the approval of the enterprise board before taking steps to apply for a loan such as filling in the loan application, and providing necessary certified documents, data, and relevant copies of contracts.

After the loan application is examined and approved by the bank, the enterprise in question should sign a debtor contract with the bank. A loan account is then opened and the loan is made based on the articles of the contract. Concerning credit loans, a written pledge must be provided by the gurantor unit approved by the bank attached to the loan contract. For mortgage loans, written evidence on the mortgage as a guarantee of repayment for the loan must be provided by the debtor enterprise with the approval of the bank attached to the loan contract.

Question: Is there a ceiling on the loan?

Answer: The ceiling for the loan must not exceed 200 percent of the registered capital of the enterprise, and a loan made with a mortgage as a guarantee of loan repayment must not exceed 70 percent of the current value of the mortgage.

Question: What are the regulations for loan repayment and interest payment?

Answer: The debtor enterprise must return the exact sum of the loan to the bank on time according to the stipulated date on the loan contract. If a loan is not repaid by the deadline, the loan must be repaid by the guarantor unit. The bank has the right to sell the mortgage of the debtor enterprise for repayment of the principal and interest of a mortgage loan. Regarding past due loans, the bank will take additional interest of between 25 and 50 percent on the basis of the original interest rate for the loan beginning from the due date.

If the debtor enterprise is unable to pay the interest on time, the bank will actively transfer the due interest to the loan account of the debtor enterprise, calculating at a compound interest rate.

REPORT ON 1985 TIANJIN BUDGET, TASKS FOR 1986

SK012310 Tianjin TIANJIN RIBAO in Chinese 14 May 86 p 3

["Excerpts" of report on the fulfillment of the 1985 financial budget and the 1986 budget tasks presented by Yue Shugong, director of the Tianjin Municipal Finance Bureau, at the 5th Session of the 10th Tianjin Municipal People's Congress on 23 April]

[Text] 1. The Implementation of the 1985 Financial Budget

In 1985, the various economic departments throughout the municipality conscientiously implemented the principle of reform, opening to the outside world, and vitalizing the economy; made important strides in reforming the urban economic structure; developed the economy in a sustained, steady, and coordinated manner; continued to raise economic results; and further improved the livelihood of the people. On this basis, the implementation of the financial budget was good. We overfulfilled the revenue task, guaranteed all necessary expenditures for various undertakings, basically met the needs of the urban economic structural reform and social and economic development, and made due contributions to achieving a fundamental turn for the better in the state's financial and economic situations.

Our municipal financial budget for 1985 was adopted at the 3d Session of the 10th Municipal People's Congress and was discussed and readjusted at the 25th Standing Committee meeting. The fulfillment of the readjusted budget was as follows:

Financial revenue reached 4,410,930,000 yuan, which was 114.1 percent of the readjusted budgetary figure of 3,865,420,000 yuan. If calculated in terms of comparable standards, the increase reached 21.2 percent over the previous year. Adding in the new urban facilities maintenance tax of 179.63 million yuan, the total financial revenue reached 4,590,560,000 yuan, thus ending the situation in which the financial revenue wavered at about 4 billion yuan for a few years. We witnessed a fairly big financial increase and succeeded in increasing production and revenue. Of the total financial revenue, the revenue from the enterprises amounted to 1,027,340,000 yuan, which was 95.3 percent of the budget, a decline of 8.8 percent from the previous year it calculated in terms of comparable standards; tax revenue came to 3,358,190,000 yuan, which was 120.8 percent of the budget, showing an increase of 21.4 percent over the previous year; and revenues from other fields came to 25.4 million yuan, which was 347.5 percent of the budget, showing an increase of 360 percent over the previous year.

In 1985, we collected 393.85 million yuan in funds for key energy and communications projects, overfulfilling the state-assigned task by 140 percent, and issued 148.39 million yuan worth of state treasury bonds, topping the state-assigned task by 3 percent.

The financial expenditures came to 2,160,380,000 yuan, which was 75.6 percent of the readjusted budgetary figure of 2,856,140,000 yuan, an increase of 19 percent over the previous year. Adding in an expenditure of 209.03 million yuan for city maintenance, the total financial expenditure reached 2,369,410,000 yuan. The breakdown of the total expenditures was as follows: 1) The expenditure for capital construction came to 1,011,590,000 yuan, which was 85.6 percent of the budget, showing an increase of 46.4 percent over the previous year it calculated in terms of comparable standards. The completion and operation of the 30 municipal key industrial projects in the light industry and textile, machinery and electronics, and metallurgical sectors helped increase the production capacity. The construction of the western half of the Zhonghuan road and the Haimen grand bridge were completed and opened to traffic, which helped improve the city operations; 2) appropriations for tapping the potential of enterprises and for carrying out technical transformation came to 97.73 million yuan. Together with the investment allocated from the municipality's centralized depreciation funds, the total expenditures reached 183.48 million yuan, showing a slight increase over the previous year; 3) the appropriations for the three scientific and technological projects came to 52.76 million yuan, which was 90.4 percent of the budget, a decline of 6.1 percent from the previous year. Of this, 20.32 million yuan was allocated from the local treasury, an increase of 13.4 percent. The special funds for such purposes given by the various central departments declined from the previous year; 4) the appropriations for supporting agriculture came to 81.2 million yuan, which was 80.1 percent of the budget, showing an increase of 8 percent over the previous year. We gave priority to developing seawater and freshwater breeding and the production of lean-meat hogs, fruits, and farm and sideline products; 5) the appropriations for cultural, educational, scientific, and public health undertakings came to 483.22 million yuan, which was 94.2 percent of the budget, showing an increase of 26.5 percent over the previous year, exceeding the growth of the regular financial revenue and that of the hotel expenditures for the allocation of funds. Of this, the appropriations for regular education came to 203.02 million yuan, an increase of 31.3 percent over the previous year. To ensure the needs of expenditures on universal education allocations, we once again readjusted the spending standards for teaching administrative expenses, with the allocations for middle schools increasing by 73 percent and those for primary schools and kindergartens by 65 percent. Expenditures on purchase of equipment came to 27.9 million yuan, an 11-percent increase over the previous year. In the course of replenishing and improving the teaching and experimental equipment of the existing schools, we equipped the newly built primary and middle schools and kindergartens with installations in coordination with the urban construction. Expenditures on repairing of schools came to 11.14 million yuan, up 91 percent over the previous year. With this fund, 50,000 square meters of hourses of primary and middle schools in the urban areas were repaired. With the state subsidies and the funds raised by various fields, we repaired and built 170,000 square meters of houses for the rural primary and middle schools. Allocations for public health undertakings came to 115.87 million yuan, up 29.8 percent over the previous year. We improved the equipment of two city-level hospitals and four district- and county-level hospitals, and added 1,285 new hospital beds; 6) allocations for administrative management came to 122.4 million yuan, 90.4 percent of the budgeted figure, fulfilling the central authorities-assigned task of reducing the administrative management expenses by 10 percent; 7) after loosening control over the prices of foodstuffs, we issued 265.44 million yuan to subsidize the prices of food stuffs, of which, 153.39 million yuan was released from the local budget; and 8) expenditures on appropriations for the simple construction projects; the industrial, communications, and communications undertakings; employment for the urban youths; urban maintenance; undertakings in other departments; social relief; and militia undertakings totaled 367.12 million yuan, showing increases of varying degrees over the previous year.

In 1985 the central authorities implemented the financial system of "differentiating the variety of taxes, checking and deciding revenue and expenditure quotas, and letting each level be responsible for its financial work" in our municipality, and fixed the municipality's proportion of retention of revenues at 39.45 percent. The municipality implemented the financial system of "deciding the basic quota, sharing the total value of revenues, and proportionate sharing of revenues" among various districts and counties, and fixed the proportion of revenue sharing at 38 percent.

In 1985 the accounts showed a favorable balance of 698.19 million yuan, of which, 500.83 million was from the municipal-level budget and 197.36 was from the county-level budget.

During the past year, with the aim of adapting to the needs of the economic structural reform and promoting social and economic development, the financial and tax departments have scored some achievements in strengthening macroeconomic management in the course of allowing flexibility in the microeconomy. To invigorate enterprises, we have cotninued to improve the plans for implementing the second step of substituting taxes for delivery of profits among state enterprises, have actively implemented measures for invigorating large and medium-sized enterprises, have appropriately relaxed control over the policies toward small enterprises, and have further intensified the vitality of enterprises. To ensure the development of various undertakings, we have not only given consideration to the needs of economic construction and the development of cultural and educational undertakings, but have also taken into account the expenses in other undertakings, thus further reationalizing the distribution of expenditures. To support the wage and price reforms, we have mainly depended on the local financial resources to properly provide the funds for wage increases of various administrative departments and establishments, and for granting the subsidies for foodstuff prices. To strengthen the management of tax revenues, we have further given play to the role of tax revenue as an economic lever, improved the tax system, and established a system for collection and management of taxes from departments in charge of foreign affairs, one which is basically suitable for the work of opening to the outside world. To develop new products and introduced the policy of giving awards to those enterprises that produce and purchase goods for export and the policy of returning taxes to enterprises that produce export goods. In 1985 a total of 112 million yuan of taxes was returned to enterprises, thus encouraging them to export more goods and earn more foreign exchange. In order to enforce financial and economic discipline, we have conducted the general survey on tax revenues, financial affairs, and market prices. Through this survey, we have not only ferreted out and handed over to the state treasury 128 million yuan in illegal money, but [words indistinct] vigorously promoted the protection of the socialist legal systems and discipline and the improvement in party style and social conduct.

While affirming the continuous improvement in the financial situation, we should also note the current difficulties and problems. Some enterprises produce poor-quality goods, and their product mix is not reational enough to suit the changes in market demands. Others have low managerial and technological levels, large material consumption, poor economic results, and poor ability for mastering and applying technologies. Investment in some capital construction projects and projects involving technical transformation measures yields slow returns, the situation of relying on state investment to expand production has yet to be thoroughly changed, and enterprises lack the ability to transform and develop themselves. Some weak links still exist in finance and tax management, and loopholes in incomes, losses and waste in expenditures, and financial and economic discipline violations are common at some units that lack a sense of law and discipline. We should conscientiously study and solve these problems in the new year.

2. The 1986 Budget

The 1986 budget has been fixed in line with the guidelines of the national financial work conference, and the major targets set in Tianjin's plan for national economic and social development.

The total budget revenue is 5,171,280,000 yuan, an increase of 6.2 percent over the previous year in terms of comparable standards. Specific arrangements are as follows: 1) the revenue collected from enterprises is 1,350,180,000 yuan, an increase of 0.5 percent over the previous year in terms of comparable standards. Of the sum, the revenue collected from industrial enterprises is 1,247,810,000 yuan, the same as the previous year; 2) taxes of various categories total 3,628, 610,000 yuan, an increase of 6.8 percent over the previous year; 3) the revenue from other sources is 10 million yuan; and 4) the urban maintenance and construction taxes total 182.49 million yuan.

As assigned by the central authorities, our municipality should collect 162 million yuan in key energy and communications construction funds, the same as the previous year, and issue 148.37 million yuan of treasury bonds, an increase of 3 percent.

The total budget expenditure is 2,975,460,000 yuan, of which 1.841 billion yuan should be allocated from the revenue of the same year, showing an increase of

7.5 percent over the previous year. Arrangements for major expenditures are as follows: 1) the spending for capital construction totals 877.86 million yuan, an increase of 2.3 percent over the previous year; 2) the spending for the three scientific and technological purposes totals 27.91 million yuan, an increase of 8.3 percent over the previous year. In addition, arrangements have been made to allocate 38 million yuan to equip key scientific research institutions, invest in intermediate experimentation, and develop "three basics"; 3) the spending in support of agricultural work totals 95.73 million yuan, an increase of 17.9 percent over the previous year. The increase is mostly intended for developing farm and sideline products, and supporting the poor; 4) the spendings for cultural, educational, scientific, and health undertakings total 582.52 million yuan, an increase of 20.5 percent over the previous year, which is higher than the increases in our municipality's revenue from regular items and in its expenditures. Of the sum, the spending for ordinary education is 249.38 million yuan, an increase of 22.8 percent over the previous year; 5) the administrative spending is 129 million yuan, an increase of 5.4 percent over the previous year, due chiefly to the fact that spending of administrative units which readjusted their wages and the business funds of public security and political and legal departments increased; 6) this year our municipality will issue 400 million yuan as nonstaple food price subsidies for residents, of which 156.37 million yuan will be issued from local revenues; and 7) the budget expenditures for tapping of potential and technical transformation of enterprises; simple construction; industrial, communications, and commercial operating expenses; urban youth employment; urban maintenance; pension and social relief funds; militia undertakings; and various [words indistinct] as for price subsidies, total 1,106,070,000 yuan, showing increases of varying degrees over the previous year.

The budget revenue this year was positive, and can be achieved as long as we overcome difficulties and maintain an appropriate growth rate in industrial production on the premise of improving economic results. Although the budget expenditure is rather strained, it can satisfy the needs of economic construction and other undertakings as long as we make meticulous calculation and rational arrangements, and strive to use our funds more effectively.

3. Strive For Fulfillment of the 1986 Financial Budget

This year is the first year of the Seventh 5-Year Plan for national economic and social development. Ensuring the sustained and stable increase in revenues is of great significance in realizing the balance between revenues and expenditures and in ensuring the development of the key construction projects and various other undertakings. To successfully complete the 1986 tasks for revenues and expenditures, we should pay attention to the work in the following fields:

1. We should vigorously increase production and practice economy, enhance economic results, and increase financial revenues.

The fundamental way out for solving financial problems lies in the development of production. Under the current situation of carrying out reform, opening to the outside world, and invigorating the economy, all our work should be aimed at opening up channels and expanding and fostering new financial sources.

This year we should strive to intensify the enterprises' self-renovation and self-development capacities through further expanding their decision-making powers and implementing various economic and financial policies. We should strive to lower production costs, economize on consumption, and enhance the enterprises' ability to digest and cope with the regulated prices and other unfavorable factors through fully tapping the internal potential of enterprises. We should also strive to enhance the various products' capacity to suit the market changes through readjusting product structure and industrial structure, and through developing new products. Various economic departments should concentrate their efforts on accelerating the capital construction projects and the pace of technical transformation, and improve the quality of construction in order to complete the construction of these projects and put them into production as early as possible. In distributing and utilizing foreign exchange, we should stress economization and rationalization, and should encourage enterprises to export more products and earn more foreign exchange. In supply and distribution of energy resources, raw materials, and funds, we should give priority to those enterprises that produce better-quality products, yield better economic results, and earn more foreign exchange through exports. All enterprises should work out ways to develop production, increase efficiency, practice economy, and oppose waste in order to fulfill the financial revenue task.

Realizing the balance between revenues and expenditures is a basic condition for the sound development of the national economy. Under the new situation of the financial structural reform, leaders at all levels and all departments should pay attention to revenues; should change the past traditional idea of the state monopoly regarding revenues, expenditures, and financial distribution; should firmly foster the new idea of deciding the expenditures in line with revenues; and should unify the thinking and pool the wisdom and efforts of the people in order to ensure a stable increase in the municipal financial revenues.

2. We should promote the financial and tax structural reform, and continue to invigorate enterprises.

Invigorating enterprises, large and medium-sized enterprises in particular, is the main task for this year's reform of financial and tax systems. While expanding the autonomy of enterprises, the state should again fix the rate of regulatory tax in line with the factors that affect the profits of enterprises, such as the new varieties of taxes collected in the past few years and the regulatory prices. We should attend to the work of reducing regulatory taxes for large and key enterprises in line with the stipulations of the State Council and the targets assigned by departments concerned. Among commercial enterprises, we should institute such management and operational forms as ownership by the state but management by collectives, and leasing trade and contract trade. In encouraging enterprises to increase exports and earn more foreign exchange, we should improve the methods for returning taxes to enterprises that produce export products. In tax collection, we should give preferential treatment to those enterprises that mainly produce products for export and earn handsome foreign exchange. In line with stipulations, we should implement an award system among enterprises that earn foreign exchange through export. In terms of the wage and price reforms, we should conscientiously sum up the experiences of some enterprises that integrate the total wage bill with economic efficiency, and should popularize, on a trial basis, the method of fixing the quota of the basic wage bill. We should reform the financial subsidy system and strictly control the subsidies to grain, cotton, edible oil, coal, meat, and eggs in order to reduce deficits and increase income. In strengthening the economic responsibility system, we should adopt policies to give awards for raw material and fuel conservation carried out by enterprises provided with necessary conditions, make the basic accounting unit smaller on a trial basis, and calculate bonuses on the basis of profits in order to boost the enthusiasm of staff members and workers. Through the implementation of the above-mentioned policies and measures, we should further invigorate enterprises, and facilitate the improvement of economic results throughout the society.

3. We should strengthen and improve macroeconomic control and pay attention to economizing on financial expenditures.

During the past few years, our municipality's expenditures for various purposes have increased in varying degrees following the improvement in the state's financial situation, but a major contradiction between demand and possibility still exists. Therefore, it is necessary to maintain a basic balance between the general supply and the general demand of society, and keep expenditures within the framework of the state plan and budget. First, the budget spending should guarantee the needs of key construction projects, and cultural, educational, scientific, and health undertakings, and the funds in support of agriculture should be appropriately increased. Second, management of plans should be improved. In addition to the annual plan, we should work out expenditure plans for various stages, and act according to the plans. When formulating plans for expenditures, all departments should make sure that the regular funds and the funds for the development of various undertakings of grassroots units are guaranteed. They should not withhold the funds at every level; still less should they purposely leave a breach. Third, the use of administrative funds and institutional purchasing power should be brought under strict control in the spirit of carrying out all undertakings through thrift and hard work, and tours, parties, and gifts using public funds should be strictly banned. Institutions which can also earn money should make proper arrangements for this, and should strive to achieve self-reliance in fund supply when conditions are ripe. Fourth, we should do a better job in the movement of funds, strengthen the control over extra-budgetary funds, fully tap the potential for fund supply, and use funds successfully and flexibly so that they can yield maximum returns.

4. We should strengthen financial management, and strictly enforce financial and economic discipline.

Financial management is the foundation of economic work, and urgently needs to be strengthened. We should conscientiously implement the "law of accounting," intensify the education on the socialist legal system, and strengthen regular financial supervision and management. [Word indistinct] better management foundation and fairly good systems should make their management work a regular system, and develop it toward standardization and systematization.

Units [word indistinct] poor foundation and chaotic management should step up establishing and improving the basic management system to gradually bring the management work onto the right track. We should plug up loopholes in policies and systems through investigations and handling of cases involving violations of financial and economic discipline.

All persons in charge of economic work, particularly party members and cadres, should abide by financial and economic discipline in an exemplary manner, bear in mind the interests of the party and the state, adhere to the socialist way of operation and management, and struggle against all erroneous acts in violation of financial and economic discipline and all economic criminal activities.

Our municipality's present economic situation is very good, but our work remains arduous if we are to fulfill this year's financial tasks. We believe that with the concerted efforts of the people throughout the municipality and conscientious work in increasing revenues and cutting expenditures, we can certainly fulfill this year's revenue and expenditure plan successfully.

FOREIGN TRADE AND INVESTMENT

PAPER REPORTS ON MULTILATERAL TRADE TALKS

HK240718 Beijing GUOJI SHANGBAO in Chinese 15 May 86 p 3

[Article by Huang Jianping [7806 0494 1627]: "The New Round of Multilateral Trade Talks and the Farm Products Trade"]

[Text] Editor's note: Agricultural and sideline products occupy an important place as far as our country's foreign exchange earnings from exports are concerned. In 1985, of the mix of our export commodities, agricultural and sideline products made up 17.5 percent. Further expansion of the international market for agricultural products can not only enable our country to earn large amounts of foreign exchange, but can also help in consolidating and developing the results of our rural economic reform. The curtain is soon to rise on a new round of multilateral trade talks. We must keep a close watch on the outlook for trade in agricultural products. [end editor's note]

U.S. trade representative Clayton Yeutter pointed out in a recent article: In the new round of multilateral talks to be started this year, a main goal of the United States is to straighten out multilateral provisions for international trade in farm produce, so that agricultural trade can develop on a relatively favorable basis in various countries.

Actually, this stand on the part of the United States is a continuation of a countermeasure that it has upheld in multilateral trade talks for as long as 20-odd years. The United States has all along thought that despite equal attention given to the problem of tariffs on farm produce and industrial products in the first four rounds of General Agreement negotiations, since the EC abolition in 1961 of reduced tariffs on imported farm produce in a switchover to a variable import levy (an import duty equivalent to the difference between the world price and the import price based on the given import price for an imported product), the problem of reduced tariffs on farm produce has all along not been put on the official agenda of multilateral negotiations. It has been discussed only at the request or suggestion of a country concerned. In fact, no country wants to make such a request, because it is feared that this would cause other countries to make appropriate demands concerning other commodities. Thus, proper control cannot be exercised over agricultural trade in regard to quotas and tariffs, heavy subsidies, and non-tariff barriers. Conditions for world trade in farm produce have shown increasing deterioration.

The problem of world trade in farm produce is, in the final analysis, one of the domestic economic policy of various countries. Given the rate of population growth in developed countries far lower than the growth of agricultural productivity and a lack of elasticity in income from farm produce and in relevant supply, governments of various countries appropriate large sums of money every year to stabilize the prices of farm produce and the peasants' income. This policy of subsidization has further greatly stimulated the excessive growth of agricultural productivity, causing grain output greatly to exceed grain consumption and the level of supply far to outstrip the level of demand. For a long time, the United States has been an exporter of agricultural products. Its total volume of primary agricultural product exports has accounted for 17 percent of the world's total. The EC has also gradually changed from being an importer of agricultural products to a region with a surplus of agricultural products.

To counter this situation, the GATT Committee on Trade and Agriculture put forth a proposal urging various countries to combine their domestic economic policies with provisions for quota restrictions and for subsidies in the General Agreement. All domestic policies and measures that can produce an effect on world trade in agricultural products should be bound by relevant provisions in the General Agreement and subject to supervision and coordination from the General Agreement. Various countries have so far been slow in responding to this proposal. But the United States has assumed an optimistic attitude toward reform of the system of world trade in farm produce. The United States thinks that though various countries oppose free trade in farm produce, the program of providing tremendous sums for price supports has become a heavy financial burden on various countries. And this is the very crux of the problem. Therefore, to stimulate the development of the whole Western economy, there is the possibility of various countries finally reaching an overall agreement of a certain kind: On the one hand, domestic measures are taken to reduce agricultural production and stimulate the flow of agricultural resources into the industrial field. On the other hand, relevant provisions are revised through multilateral negotiations, and various tariff and non-tariff barriers in current world trade in farm produce are broken down to put trade in farm produce on the path to free trade.

HEILONGJIANG SEEKS FOREIGN COOPERATION IN DEVELOPING ECONOMY

Beijing PEOPLE'S DAILY OVERSEAS EDITION in Chinese 29 Oct 85 p 3

[Article by Li Huimin [2621 1920 3046] and Wang Baozin [3769 1405 2946]: "Face the Nation and Face The World; Heilongjiang Opens Province Door To Expand Multifaceted, Multistyle Economic and Technical Cooperation"]

[Text] The government of Heilongjiang recently summed up the task of revitalizing domestic life and opening up toward the world: Face the nation and the world and cooperatively develop various styles, ways, levels, and locations of economic and technical exchange.

The northerly located Heilongjiang is rich in resources, has adequate transportation and shipping, a solid industrial and agricultural base and a vast market potential. In essence, it is an excellent environment for technical and economic cooperation. In recent years, the province has established economic and trade connections with more than 1,700 clients from more than 100 nations and areas; it has also signed more than 220 project agreements with foreigners for the development of new industries as well as the expansion and technical transformation of older enterprises. These projects have a total value of $300 million and more than 370 foreign technological items have been introduced into China.

Provincial Secretary Hou Jie [0186 2212] says that while economic and technical cooperation with foreigners has had a measure of success, it is still insufficient, the areas below should be the subject of vigorous and extensive cooperation.

The energy and transportation industries must be developed. The five largest river systems in the province--the Heilong, the Niaosuli, the Songhua, the Nen and the Suifen have been approved for the construction of 270 large, medium and small hydroelectric stations with a holding capacity of 6.12 ?mW (billion watts). Coal reserves hold an important place nationally. These resources can be utilized. Hydroelectric plants must be cooperatively developed; coal must be mined and processed chemically for use in large and medium-sized cities as coal gas and as a heat supply for engineering. Electric plants as well as other projects must be developed. As to transportation and shipping, railroads supplied by local energy can be cooperatively constructed as can railroads between coastal cities and the interior. Also, Harbin's international airport should be taken advantage of in setting up a cooperative, international air cargo service.

The mineral industry should be developed. Investigation has shown that there are more than 50 kinds of mineral resources in the province. Among them are energy resources like oil, coal, and shale oil; dark metals, such as iron, titanium, and manganese; colored minerals, such as copper, lead, gold, silver, and zinc, as well as minerals for the chemical industry, such as phosphorus, mirabilite, and lye. Other mineral resources include limestone, marble, graphite, mica, and (prezoelectric) crystal. Various mining, smelting, processing, and integrated-utilization projects can be cooperatively developed.

The processing industry for agricultural byproducts should be expanded. In Heilongjiang there are now more than 130 million mu under cultivation. The world has seldom seen such black soil. Wheat, corn, soybeans, cereals, potatoes, and other food items are produced in abundance, as are other basic commodities, such as vegetable oil, sugar beet, tobacco, and flax. Heilongjiang has more than 4 million mu of reed ponds, more than anywhere else in China. There are more than ?30 (3 million) head of sheep and goats with annual wool production in excess of (10,000) tons. This preponderance of resources can be brought to bear economically in various and sundry processed items, such as food oils, animal feed, ?refined (process) sugar, paper, and wool and hemp fibers.

The food industry must be developed. Heilongjiang has 13 counties that are either entirely devoted to animal husbandry or one-half agriculture and one-half animal husbandry. Heilongjiang leads the nation in total head of cattle and fresh milk production. In the greater and smaller Xingan mountain ranges of the north and northwest and in the mountainous region of southeastern Heilongjiang, (woodear), mushrooms, pine trees, grapes, roses, the (Micacus monkey peach) and other special food items grow abundantly. Food, starch, dairy products, brewing and beverage industries are thus waiting to be developed.

Finally, older enterprises must be technologically transformed. At present there are more than (15,000) industrial enterprises in Heilongjiang; among these are more than 280 large-scale enterprises. In the near future, more than 100 large and medium-sized enterprises will be upgraded and a number of small-scale enterprises will proceed to improve both quality and efficiency. These transformation projects require financial, technical, material, and human cooperation.

FISHING TRAWLERS IN IRANIAN PORT--Tehran, May 28 (XINHUA)--Four Chinese trawlers arrived in the Iranian port of 'Abbas today after 26 days of voyage. The trawlers came to the Iranian port under an agreement signed between the fishing organizations of the two countries for fishing operations in Iranian waters in the Oman Sea. The catch of the Chinese trawlers will be sold to Iran at the prices both sides agreed, while Iran will provide free logistic support to the Chinese trawlers. This is the first project of Sino-Iranian economic cooperation after the 1979 Islamic revolution of Iran. [Text] [Beijing XINHUA in English 0001 GMT 29 May 86 OW] /12712

FINNISH LOAN TO CHINA--According to a report from Finland (NEW FINLAND NEWS), the Finnish Government has formally decided to extend a development loan to China worth 50 million markka. Concrete consultations on this subject will begin in October. This will be the first loan Finland has extended to China. The report said that "soft loans being in short supply, Finland's export sector cannot compete with other Western nations." "Finland intends to apply an integrated loan method to improve its export competitiveness in both the China and Indonesia market." As the report points out, "Seldom is Finland's development aid in the form of a development loan. This is the first time a development loan has been tied to commercial credit. This integrated loan approach to be offered Indonesia and China is a means to support Finland's exports." It has been reported that conditions for the Finland development loan are as follows: the yearly interest rate will be 0.75 percent and it will be repaid over a 25-year period (with an extendable deadline of 7 years). In combination with the export credit, the development loan should be about 35 percent of the total loan, and cannot be less than 20 percent. This loan is good for such Finnish specialties as forest and paper products, smelting, dairy products, hydroelectric power development, and harbor construction, etc. This loan will be administered by the International Development Agency of Finland's Foreign Affairs Ministry. XIAMEN SPECIAL ZONE CONTINUES TO OPEN DOOR

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 29 Oct 86 p 1

[Article by Guo Longchun [6753 7893 2504] and reported by Xiamen DAILY NEWS reporter Yan Zhiqiang [7346 2535 1730]: "Xiamen's Special Zone Further Implements Open Door Policy; Products Can Be Exported from Self-Managed Special Zone and Necessary Commodities Can Be Imported; Duty-Free, Entrepot and Transit Trade Service To Be Started']

[Text] October of this year was the fifth anniversary of the creation of the Xiamen SEZ. Not long ago the State Council replied in writing to the Fujian People's Government (concerning the examination of Xiamen's SEZ implementation plan) and approved a further opening of Xiamen's SEZ. Xiamen's vice mayor Jiang Ping [3068 1627] recently told reporters that in the last 5 years a good foundation was laid for Xiamen's SEZ. The State Council wants the development of Xiamen's SEZ to pick up the pace and enter a new era.

Since the creation of Xiamen's SEZ, at the Huli Industrial Park the five aspects of infrastructure and site leveling have been completed (electricity, water, air, roads, and telecommunications), a new international airport has been constructed, four 10,000- and 50,000-ton port berths have been built and a modern communications system has been set up. The opening step has been taken in creating a favorable investment climate for foreign businessmen. Up until the end of September this year, 271 formal agreements had been signed for joint investment, joint management, and individual foreign investment ventures. Total foreign investment is worth $600 million.

Vice Mayor Jiang also announced that the State Council has approved the expansion of the SEZ from the original 2.5 square KM of the Huli area to all of Xiamen Island as well as all of Gulang Island. At the same time, Xiamen's SEZ will be altered from its original status as an export and industrial park into a SEZ geared toward the outside world, with industry as the core as well as travel, commercial, and real estate sectors under integrated management. In this way, the extent of foreign investment can be broadened. Within the 131 square km of Xiamen and Qulang they can engage in industry, commerce, travel, real estate, and many other concerns that are well worth the effort.

Among new policies that the State Council approved for Xiamen's SEZ is its gradual evolution into a free port. Under the unified national trade policies, Xiamen's special zone status allows self-management regarding the import of needed commodities and export of domestic goods, the development of transit and entrepot trade services and with the exception of integrated management enterprises, the acceptance of commissions from domestic enterprises to provide services for commodity import and export.

Vice Mayor Jiang said that a duty-free entrepot is an important policy of an international free port. Outside of weapons and poisonous substances, Xiamen SEZ now permits foreign products to be stored in certain areas, processed, packed, labeled and reshipped for export. None of these commodities will be subject to customs, or to import or value-added taxation. This will generate interest among foreign businessmen.

Regarding finances, Xiamen will be able to establish a financial structure in accordance with national regulations: Special banks are permitted to deal in foreign currencies within the area and free deposit and withdrawal are guaranteed. The State Council has approved the right to borrow money and issue bonds overseas, sell stock, raise funds for development and set up services for public bond administration and over-the-counter stock transactions. Foreign banks are permitted to open for business in these special zones. This year the Xiamen Chinese-Foreign Joint Capital International Bank opened for business and the Singapore Dahua Bank has already received approval to set up a branch in Xiamen.

Asked by reporters how the Xiamen People's Government can implement the State Council's plan, Jiang Ping replied that a diligent effort must be made to establish foreign capital as the principal source of funding. Modern industry must be the linchpin of the production structure and export goods must be the core of an externally oriented economy. Those projects that can create foreign exchange must have priority and funds must be used effectively. Finally, various means for the accumulation of foreign reserves must be created including travel, entrepot trade, labor exportation and industrial processing.

XIAMEN BEGINS WORK ON SECOND STAGE INFRASTRUCTURE

Beijing RENMIN RIBAO OVERSEAS EDITION in Chinese 18 Nov 85 p 1

[Article reported by Shi Zhengyao [2457 1513 1031] and Wang Qiahang [3769 1874 3801]: "Accelerate Establishment of Special Zones and Improve the Investment Climate; Xiamen Begins Work on Second-Stage Infrastructure]

[Text] The man in charge of capital construction for Xiamen told reporters today that work on second-stage infrastructure in the Xiamen SEZ has already begun. Important engineering projects involve water supplies, energy, telecommunications, shipping and transportation.

These projects will be completed between 1986 and 1990.

Since the Xiamen SEZ was established in 1980, more than 600 million RMB have been invested in completing first-stage infrastructure projects. This has improved the investment climate of Xiamen's SEZ, but judging from the situation in the zone, it is still unsatisfactory.

Among second-stage infrastructure projects, Xiamen is planning a 600,000 kW thermal power plant. At present the electrical circuitry for the entire city is being revamped.

To start the second stage of constructing the Dong Du port, five deepwater berths are being built. When the project is completed Xiamen harbor's yearly handling capacity will increase from 2 million tons to more than 10 million tons.

Xiamen can now furnish 130,000 tons of water daily, which meets basic needs. By 1990, it is expected that water use will increase to more than 300,000 tons daily. Consequently, Xiamen is starting a project designed to bring water from the mainland to the island and act as a new water source.

Other construction projects include: A six-lane highway that crosses the ocean and joins Xiamen to the mainland, expansion of Xiamen's international airport which will open up new international air routes and the accelerated electrification of the Xiamen-Yingtan Railway.

As to telecommunications facilities, Xiamen will import 20,000 programmed telephones.

BRIEFS

INTERNATIONAL AIRPORT FOR SHENZHEN SEZ--Shenzhen, June 3 (XINHUA)--Work is expected to start on an international airport at the Shenzhen Special Economic Zone later this year following the presentation to local authorities today of a feasibility study. The airport will be built 30 kilometers from the center of the southern Chinese city. The first stage of construction, which will cost an estimated 210 million yuan, is likely to be completed by 1989, said a city official attending today's presentation ceremony. This first stage will include a 2,800-meter-long runway, which aircraft such as Boeing 737s and Tridents will be able to use. It is estimated that the airport will be used by 1,200,000 passengers and will handle 50,000 tons of cargo a year. Eventually, the airport will be enlarged for use by jumbo jets, and its annual handling capacity will increase to five million passengers and 200,000 tons of cargo. The feasibility study was prepared by a joint United States firm of consultants comprising Parsons International and Lockheed Air Terminal, which was chosen by local authorities and aviation officials from bids by more than 60 foreign companies. The study was financed by the U.S. Trade and Development Program. [Text] [Beijing XINHUA in English 1505 GMT 3 Jun 86 OW] /12712

HEBEI'S XING CHONGZHI ATTENDS MODEL LABORERS GATHERING

SK060826 Shijiazhuang HEBEI RIBAO in Chinese 22 May 86 p 1

[Excerpts] On the morning of 21 May, the Hebei Provincial Conference of representatives of the advanced units and individuals was ceremoniously opened in Shijiazhuang City.

Attending the conference were 256 labor models and the representatives of 59 advanced units and collectives, including those of veteran models who had scored marked achievements during the past several years in arduously conducting pioneering work and working hard for the program of building the four modernizations, and those of model workers who had emerged during the period since the 12th CPC Congress in ideological and political work, in the drive to conduct technical renovations, and in production, services, and educational work. Also attending the conference as special invited representatives were 41 provincial labor models who had won the national "MayDay" medal, the combat heroes of the PLA units, and the dependents of staff members and workers.

Attending today's conference and seated at the front of the rostrum of the conference were leading comrades from the provincial CPC Committee, the provincial Advisory Commission, the provincial People's Congress Standing Committee, the provincial People's Government, and the provincial CPPCC Committee, including Xing Chongzhi, Xie Feng, Li Wenshan, Yang Zejiang, Zhang Chao, Ye Liansong, Lu Chuanzan, Qu Weizhen, Zhang Runshen, Song Shuhua, Wang Yu, and Xu Chunxing, and responsible comrades from the provincial trade union council and the provincial women's federation.

Zhang Fuyou, member of the secretariat under the All-China Federation of Trade Unions, attended the conference and delivered a speech.

Ye Liansong, standing committee member of the provincial CPC Committee and vice governor of the province, presided over the opening ceremony of the conference, at which Xie Feng, deputy secretary of the provincial CPC Committee and governor of the province, delivered a speech.

In the period since 1982, the conference is another grand meeting attended by the models from various social circles throughout the province. The conference can also be regarded as an experience-exchange meeting in which the participants can learn from each other and from others' strong points to offset their weaknesses, and as an oath-taking meeting for making contributions to fulfilling the Seventh 5-Year Plan by working together for a splendid future, upholding the principle of conducting reforms, pioneering roads of advance, and whipping up an enthusiastic upsurge in the socialist emulation drive. Prior to the conference, localities across the province elected 504 provincial-level labor models and 120 advanced units and collectives. During the conference, representatives will extensively exchange their experience and adopt a letter of proposals. The provincial People's Government will make a decision to commend the advanced and to confer prizes on them.

AGING OF CHINESE POPULATION ANALYZED

Beijing RENKOU YANJIU [POPULATION RESEARCH] in Chinese No 6, 29 Nov 85 pp 28-30

[Article by Xu Qin [1776 0530], National Commission on Aging: "Analysis of the Aging Process and Characteristics of China's Population"]

[Text] The aging trend of China's population has received widespread attention. However, judging from what has been published there are several different predictions on the aging of China's population. (See Table 1) Differences in the forecasting method used produces similar figures for the year 2000 but a very great difference for the year 2040.

Forecasts of aging trends in the population depend upon predictions of the elderly population and of the general population. The elderly of the next 60 years are already born and the size of the elderly population in the future will be determined entirely by the death rate. Unavoidable differences in prediction arise from different estimates of what the death rate will be in the future. These differences are explained below through predictions according to two different scenarios based on data from the 1982 Chinese census. (See Table 2)

Table 1. Predictions of the Chinese Population over Age 65 in the Years 2000 and 2040

Year	2000		2040	
Forecaster	Pop. in 100 Millions	Percent of Total	Pop. in 100 Millions	Percent of Total
Tian Xueyuan	0.91	7.5	2.3	20.2
Song Jiandeng	0.94	8.3	4.0	34.8
Cheng Yuqin	0.95	7.6	4.0	25.8
Xiao Zhenyu	0.88	7	--	--

(Footnote 1) (Tian Xueyuan [3944 7185 3293], "On Changes in the Age Structure of the Population and Selections Population Planning Programs," TFR=1.5; Song Jiandeng and others [1345 0256 4583], "Population Forecast and Population Control," TFR=1.5; Cheng Yuqin [4453 3768 3830], "The Present and Future of China's Population," TFR=2.0; Xiao Zhenyu [5135 2182 4416].

Table 2. Predictions Using Different Death Rate Scenarios and Their Results

			1982	2000	2040
Scenario A	Life Expectancy (years)	Males	66.3	71.7	71.7
		Females	69.4	74.4	74.7
	Over 65 Population (millions)		49	96	295
Scenario B	Life Expectancy (years)	Males	66.3	71.7	78.3
		Females	69.4	74.7	80.4
	Over 65 Population (millions)		49	96	392

In scenario A, the death rate stays constant between 2000 and 2040. In scenario B, the death rate declines steadily resulting in nearly 100 million more elderly in the population in 2040, nearly one-third more than in scenario A. This difference of 100 million demonstrates the great importance of selecting the death rate parameter in predicting the elderly population.

Predicting the size of the total population is different from predicting the size of the elderly population because not only the death rate but also the birth rate must be taken into account. (See Table 3)

Table 3. (A) Different Fertility Programs (TFR)

Year	1982	2000	2040
Scenario C	2.6	2.1	2.1
Scenario D	2.6	1.5	1.5

Note: See previous table for death rate (here, life expectancy) scenario

Table 4. Predictions of the Percentage of the Population Above Age 65 in 2040

Scenario	AC	AD	BC	BD
Total Population (millions)	15.73	12.33	16.95	13.50
Percentage of the Population over Age 65	18.8	24.0	23.1	29.1

Differences between scenarios for 2040 amount to 462 million in the general population and 10.3 percent in the proportion of elderly people in the population, for which predictions run between 29.1 and 18.8 percent. Obviously the selection of the fertility and death rate parameters is extremely important in making predictions on the elderly population. Therefore the results of any prediction are valid only under certain conditions and contain a large element of guesswork. Nonetheless, the various predictions on China's elderly population agree fundamentally on the overall aging trend of China's population. Currently many demographers are making predictions on the future aging trends in China's population. They select different parameters and obtain different predictions. Here the more plausible predictions are analyzed. (See Table 5)

Table 5. Several Predictions on the Aging Trend of China's Population (2)

Forecaster	2000		2025		2040	
	65+ (millions)	Percent of Pop.	65+ (mil.)	Percent of Pop.	65+ (mil.)	Percent of Pop.
Song Jiandeng (1)	94	7.8	221	15.4	400	26.4
Cheng Yuqin (2)	95	7.6	--	13.6 (2020)	400	25.4
National Commission on Aging (3)	93	7.3	208	13.8	340	22.0

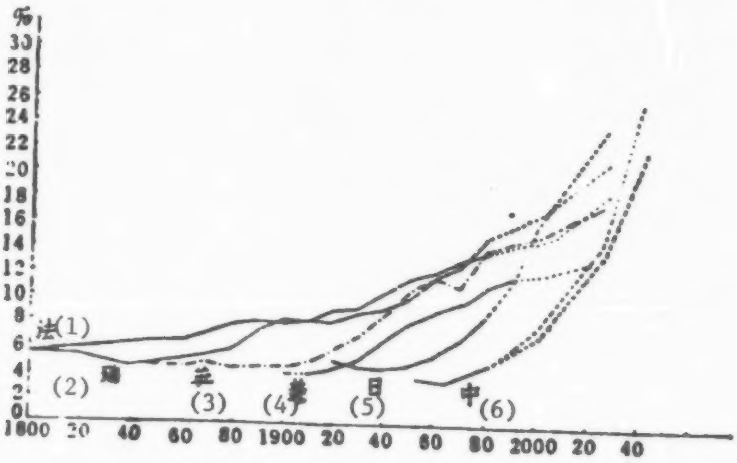
(Footnote 2)

(1) "Population Forecast and Population Control" p. 181.
(2) "The Present and Future of China's Population," Science and Technology Reference Data Vol. 723
(3) The 1984's Calculation by the State Commission on Aging Problems

The population aging process of the next 60 years can be divided into three stages. The first stage extends from 1982 to 2000. At the end of this century the proportion of people over age 65 in China's population will exceed 7 percent and China will begin to become an elderly society. The proportion of elderly in the population increases steadily in the second stage, extending from 2000 to 2025, until it reaches 13 to 15 percent in the year 2025. The increase from 7 percent to approximately 14 percent took Sweden 85 years but will take China just 25 years. During the third stage, extending from 2025 to 2040, the proportion of elderly in the population will increase from 13 to 15 percent (the highest level in the world in 1980) to 22 to 26 percent (which will equal the highest level in the world in 2025). (Footnote 3) (Kuroda Yoshio: "Japan's Population," p 10) Today there is one elderly person over age 65 among every 20 people in China: in 2040 it is estimated that there will be one elderly person among every 4 or 5 people. Then as the proportion of elderly people in China's population increases the population aging process in the advanced countries will be reversing itself and the proportion of elderly people in their populations will gradually decline from a peak to its proportion in a static population. Considering the aging trend of the population, this third stage will be the most difficult one. The characteristics of the third stage of the aging process of China's population is gradual growth and then acceleration to a peak. During the first stage the degree of aging will not be very great and problems will not be serious. However, if we are not aware of the trend of development of the latter two stages, and especially the severity of the third stage, the relative stability of the first stage may lull us into not paying the attention we should to the future acceleration of the aging process of the population. Therefore, we must begin to conscientiously study the aging process of China's population. In comparison with the developed countries, the aging process of China's population has its specific features. It has high aging rate and degree. It is characterized by the rapid growth of absolute quantity and relative proportion.

First, the elderly population is growing rapidly. If the population develops according to the above scenario, by the year 2000 there will be 90 million

Figure: China, Japan, Sweden, France, United Kingdom, and United States Curves Showing the Proportional of Elderly People in the General Population



KEY: (1) France
(2) Sweden
(3) United Kingdom
(4) United States
(5) Japan
(6) China

Chinese over age 65, double the number in 1982. In 2040, the elderly population will approach 400 million, having quadrupled in 40 years. Over the next 58 years, the elderly population will grow at an annual rate of 3 percent annually. No developed country except Japan has such a rapid rate of increase in its elderly population. Although in 1980 the proportion of Sweden's population over age 65 reached 15 percent, the highest proportion in the world, the rate of increase of the proportion of the elderly in the population exceeded 3 percent annually only for one decade (1880 to 1890). (Footnote 4) (Calculated according to "European Historical Statistics") The annual growth rate of Japan's elderly population exceeds 3 percent for just 25 years (1964 to 1984 and 1995 to 2000). (Footnote 5) (According to calculations in "Trends in 21st Century Japan" and "Population Structure." Chinese data calculated for this article)

In the future, the overall population growth rate will gradually decrease. Population growth around 2040 is predicted to be less than 0.5 percent annually. Over the next 60 years overall population growth in China will gradually decrease as the elderly population continues to grow rapidly. Therefore China's population growth problem of the 1950's and 1960's will gradually change into a problem of the age structure of the population.

Second, the proportion of elderly people in the general population is growing rapidly. From the curves below we can see that the rate of aging of China's population is similar to Japan's, although China lags a generation behind, and it is much faster than any other developed country.

The rapid change in China's population reproduction type causes the Chinese population to age. If we compare China with Sweden and Japan we can easily see that the speed of the decline of mortality and fertility in China not only exceeds that of 19th century Sweden when it became an elderly population type country but also far exceeds that of the developed country which is changing its population type the most rapidly--Japan. (See Table 6)

Table 6. Comparison of Changes in the Birth and Death Rates of China, Japan and Sweden

	China		Japan		Sweden	
Birth rate (percent)	3.411	2.109	3.41	2.15	3.45	2.22
Corresponding period 1969	1969	1982	1928	1953	1800-29	1910-19

*Shanghai data

(Footnote 6) (For China, birth rate: "China Statistical Handbook 1983," p 105; gross fertility: "Analysis of the National 1/1000th Fertility Sampling Survey," pp 49-50: life expectancy: Zou Yiren [6760 0181 0088]. "Research on Changes in the Population of Old Shanghai," p 139; for 1981 figures see "People's Daily," 25 March 1984. For Japan, birth rate: Ozu Hiroshi: "Theory of Population Economics," p 191; gross fertility: Shen Yimin [3088 4135 3046] "World Censuses of the Last 30 Years and Population," p 548; life expectancy: "Trends in 21st Century Japan," p 108. For Sweden, birth rate: "European Historical Statistics," pp 80-100; life expectancy: same as Footnote 5, p 133.

The decline in fertility is the decisive factor in the aging of the population although we cannot ignore the role of the decline in mortality. In 1981, China's gross fertility reached the relatively low level of 2.63 which is still higher than the 2.0 of the developed countries. (Footnote 7) (American Demographic Data Company: "Data Cards on 1980 World Population") In the future, fertility will continue to decline but will not have any more very large decreases. With improvements in the standard of living of the people, the urbanization of the population, and improvements in medicine and sanitation there is great potential for declines in mortality. It is entirely possible that average life expectancy will increase by 10 years in the next half century. We should be alert in the future to the influence which declines in mortality, and especially mortality in the elderly age cohorts, will have on the aging of China's population.

Although China is not yet a developed country, it is comparable to Japan in the aging of its population, lagging only by 10 to 15 years. In order to endure the pressure of having the world's most elderly population, in the future we must struggle to reduce the gap in economic development separating us from the advanced countries to 20 years. Undoubtedly a very great problem confronts us.

TRANSPORTATION

XINJIANG EXPANDS LAND, AIR TRANSPORT NETWORK

OW261128 Beijing XINHUA in English 1111 GMT 26 May 86

[Text] Urumqi, May 26 (XINHUA)--To improve its economy and attract foreign investment, northwest China's Xinjiang Uygur autonomous region has been building railroads and highways and expanding its air traffic, a regional official said here today.

Construction began last year on the 240-kilometer railroad between the regional capital of Urumqi and the city of Usu. After that route is finished, the railroad will be extended west to the Sino-Soviet border at Alataw Pass, said Zhang Sixue, deputy secretary of the regional committee of the Chinese Communist Party.

At the pass, he said, the railroad will be linked with a Soviet line--opening up new possibilities for Asian and Near Eastern trade. Until then, although Xinjiang borders the Soviet Union, the nearest rail link will continue to be 2,000 kilometers away in inner Mongolia.

The region is upgrading narrow and often unpaved winding roads linking Kashi City to Kunjirap, an outlet at the Sino-Pakistani border and to Tuerdat at the Sino-Soviet border.

Xinjiang began flying live sheep to the Middle East earlier in the decade, and it will soon begin flying fresh fruits and vegetables.

Later this month, the Urumqi Airport will begin offering international passenger service to Addis Ababa.

Between 1980 and the end of last month, Xinjiang concluded 28 foreign investment agreements, Zhang said.

Of these, 22 ventures involving 110 million U.S. dollars and investors from 21 countries and regions are active.

COMMENTARY EXAMINES STATUS OF MACAO'S ECONOMY

HK050747 Hong Kong ZHONGGUO XINWEN SHE in Chinese 0337 GMT 4 Jun 86

[Short Commentary by Zhong Zhengxiang [6988 1794 4392]: "Macao Economy Is Developing Toward Diversification"]

[Text] Hong Kong, 4 Jun (ZHONGGUO XINWEN SHE)--In the past, Macao, a city known as the "Monte Carlo of the East" gave people the impression that it was a very small city existing due to gambling. Now, as its exports manufacturing industry has developed quickly, there has been an initial change in its image as a "casino city." It has gradually established a diversified economic structure consisting of an export-oriented manufacturing industry, tourism (including gambling), the construction and properties industry, and financial undertakings.

Macao's economy has developed very quickly. According to the statistics provided by the UN World Economic Cooperation and Development Organization, in the 10 years from 1971-1981, Macao's GNP rose by an average annual rate of 16.7 percent (Hong Kong's GNP rose by an average annual rate of 10.4 percent in the same period). It was thus one of the areas with the highest economic growth rates in the world. Over the past few years, it has maintained its high economic growth rate. The growth rates for 1983 and 1984 were respectively 10 and 9 percent. In 1984, its per capita GNP reached $3,800. Despite the influence of the slowing down of the Western economy, its GNP still rose by 4 percent last year.

Macao's export-oriented manufacturing industry is the major sector that has contributed to Macao's economic development. During the 1950's, it had only some handicraft industries that produced matches, crackers, and incense. According to statistics, in 1957 there were 107 handicraft industrial enterprises in Macao, which employed over 14,000 workers and which turned out only a total annual industrial output value of 26 million or so patacas, a pataca is pegged to a Hong Kong dollar, but is 3 percent lower in value than Hong Kong dollar). Now there are over 1,300 factories in Macao, which exported manufactured goods worth more than 7.3 billion patacas in 1984. Last year Macao's exports of manufactured goods dropped a little but were still worth more than 7.1 patacas.

Macao's industrial production is diversifying. In the 1970's, only textile and clothing industries developed prosperously in Macao. Macao's toy, artificial silk flower, and electronics industries have risen. As a result, the proportion of exports of clothing and textiles in its total volume of exports dropped from 88.5 percent (in 1977) to about 70 percent. It has also gradually expanded its export market. It has been developing exports to the Chinese mainland, Japan, Eastern Europe, Southeast Asia, and other areas in addition to the EEC, the United States, and Hong Kong.

In Macao's current economic structure, the export-oriented manufacturing industry has become a major sector producing about 40 percent of Macao's GNP. Its tourism sector (including gambling) contributes 25 percent of its GNP. The fall in the percentage of tourism and gambling in Macao's economy to second place does not mean a depression in these areas. As a matter of fact, the number of tourists has risen year by year. In 1964, there were just over 500,000 tourists visiting Macao, but there were more than 4 million tourists in each of the past 4 years. Gambling is the main sector of Macao's tourism industry and the most important factor that attracts tourists. Its gambling sector began to develop in the Daoguang and Xianfeng reigns of the Qing Dynasty. It already has a history of over 100 years. Gambling is an undertaking that Macao is specialized in and is a characteristic of Macao's economy. The several casinos there now earn over 2 billion patacas in income a year, accounting for over 20 percent of its annual GNP. Gambling tax is one of the Macao Government's major financial sources. Over the past 2 years the Macao Tourism and Entertainment Company has paid about 450 million patacas on average a year, which accounts for more than 50 percent of the government's tax revenue. The gambling sector has boosted the development of hotels, catering, and shipping between Hong Kong and Macao. It provides jobs for nearly 10,000 people (accounting for 1/16 of Macao's employed population). Macao's economy today still cannot be freed from its dependence on its gambling industry, which will continue to exist for a long time in the future.

The construction and properties industry is the third major pillar of Macao's economy, contributing 8 percent of its GNP. Over the past few years, it has dropped from its peak, but since the latter half of 1984, it has begun to regain its impetus. Last year its growth rate reached 11 percent, the highest among all trades. This year, the utilization of the capacity of this industry and the number of construction sites are both greater than those last year. However, there are still many industrial, commercial, and residential sites idle now.

Macao's financial undertakings have also developed quickly. In 1983, nine foreign capital banks began to operate in Macao. This pushed up the number of banks in Macao to 23. According to the statistics at the end of last September in bank deposits in Macao totalled 15,170 million patacas or so and bank loans totalled over 10,990 million patacas. The ratio of bank deposits to bank loans was 72.5 percent.

Macao's economy is of the sea-island type. It lacks resources and raw materials and relies much on the outside world. For a period in the past, there was relatively great development in its industry, but almost all its industry is small-scale labor-intensive processing industry and most of the products are of medium or low grades. Much of its production equipment is at the level of the 1960's and 1970's. It lacks its own product design and development departments and its workers' level of skill and knowledge is a little too low. More than 90 percent of the medium and high-level technical and management personnel have come from Hong Kong. According to factory owners' estimates, about 90 percent of factories lack manpower. The four major industries--clothing, toys, artificial silk flowers, and electronics--all find it difficult to obtain skilled labor and turnover is very high. The employees there think that their wages are too low.

However, Macao is an export-oriented area with a certain economic foundation. It has widespread international relations and conducts economic contacts and trade with over 100 countries and areas. It has become a contracting party to the "General Agreement on Tariffs and Trade," and is a subordinate organization for the "Multifiber Arrangement." It is benefitted by the "General Preferential Tariff Agreement," and more than 2,700 of its products enjoy EEC "preferential tariff" treatment. Macao is a free port with low tax rate, wage, and factory rent. In addition, it is provided with export quotas. Therefore, it has fairly great attraction to draw in investment by foreign and Hong Kong businessmen. As a matter of fact, a crucial reason why Macao's industry developed so quickly in the past was that owing to the restriction of export quotas, Hong Kong businessmen vied with one another in making investment and setting up factories in Macao. At present, over 60 percent of Macao's industrial capital is Hong Kong capital. Macao is also the third biggest market for Hong Kong's exports. The Chinese mainland is a backing for Macao. Over the past few years, the mainland's annual volume of exports to Macao amounted to about $300 million. Macao gets its drinking water and part of its electricity from the mainland. The implementation of the open policy in the mainland is yielding an increasingly great impact on Macao's economic development and on maintaining Macao's free port status. The development of the Zhuhai Special Economic Zone near Macao also boosts Macao's economic development. Macao has already become a bridge for economic exchange between China and other countries. Because of the above factors and role, and because of Macao's own economic capacity, we can expect that after the Macao issue is solved, its economy will achieve long-term steady development.

PROVINCIAL VARIATION OF URBANIZATION IN CHINA

Beijing DILI XUEBAO [ACTA GEOGRAPHICA SINICA] in Chinese and English Vol 41, No 1, Mar 86 pp 8-21

[Text] China's cities belong to the clustered pattern, examining them by Kolmogorov-Aminov formula and the Lorenz curve. The highest density of cities and towns has happened in Shanghai municipality: 56.77 cities and towns per 10,000 km^2. Zheijiang and Jiangsu Provinces occupy second and third places, according to the density of urban settlements: 17.06 and 11.67 cities and towns per 10,000 km^2 respectively. The lowest density indexes of cities and towns are found in Xizang Autonomous Region and Qinghai: 0.08 and 0.12 respectively, the density of cities and towns is regularly reducing from East to West in China. The provincial variation of the density of cities and towns can be explained by the recession analysis of the density of cities and towns. A multiple correlation coefficient is 0.96, which was found by multiple regression analysis of the density of urban settlements with the gross industrial and agricultural output value, per capita industrial output, the index of the railway length, per rural person grain output, and population density as independent variables. These five variables can explain 92% of the provincial variation of the density of urban settlements.

Because the urbanization is measured by the proportion of urban population to the Provincial total ones, the urbanization level of these provinces with concentration of urban settlements and urban population seems to be not so high. Most

of the relatively high urbanized provinces and autonomous regions are located in Northeast, North and Northwest China, while the provinces with moderate and lower urbanization level are found in the East, Central and South provinces. Variables of population density, size of area, and industrial-agricultural output ratio, per capita industrial output, per capita agricultural output, per capita total production output can be used a for reflection of provinces' population and economic characteristics respectively. Two factors are identified by factor analysis with varimax rotation. The first factor is industrialization that measures the levels of industrialization and productivity and the second factor-ispopulation density that reflects the general population distribution characteristics of a province or an autonomous region. As these two factors are orthogonal each other, it suggests that there is not direct relationship between the industrialization level with population size or density in every province or aut. region. A multiple correlation coefficient of 0.863 has been obtained by multiple regression analysis between urbanization level with the factor scores of industrialization level and population density as independent variables. These two factors could explain 74.5% of the provincial variation of urbanization level. The urbanization level of a province or an autonomous region is related positively with industrialization level but negatively with population density. The industrial distribution policy encourages urbanization for the less densely populated Northeast, North and Northwest provinces and autonomous regions. To a certain extent, the control of urban population discourages urbanization for the densely populated East.

There is big variation in the primacy index of the provinces in China. It ranges from 1,009 in Auhui to 10.23 in Qinghai (in 1982). The provinces and autonomous regions with high primacy index are mainly concentrated in the Northwest and Southwest regions of China, except Guangdong an Hubei provinces. The indexes of provinces and aut. regions in West China have increased since liberation, but in recent years, they have begun to fall in some provinces and autonomous regions. Most of the Northeast, East, North, and Central South provinces have moderate or low primacy indexes, which have declined since liberation. The provincial variation of the urban primacy index may be explained by the urban development history, the development potential of the primacy city in provinces, the national industrial distribution policy and different stages of the economic development of provinces and autonomous regions.

In recent years, due to practising the open policy to the outside world the policy permitting peasants to go into towns to do businesses on the basis of self food supply and other policies as well, the urbanization process has been speeded up, urban primacy index has been relatively raised in some provinces and aut. regions, and the development of small towns has been greatly made.

'BUY AMERICAN' MISSION PREPARES FOR U.S. VISIT

OW060439 Taipei CNA in English 0327 GMT 6 Jun 86

[Text] Taipei, 5 Jun (CNA)--The 12th "buy American" mission of the Republic of China [ROC] is scheduled to leave for the United States 23 August to purchase more than U.S.$300 million worth of American industrial and agricultural products in 16 states and Washington, D.C., a spokesman for the Board of Foreign Trade [BOFT] said Thursday.

He said the Vincent C. Siew, BOFT director general, presided over a meeting at the BOFT in the afternoon with representatives from the Foreign Ministry, the Government Information Office, Central Trust of China, China Steel Corp., Chinese Petroleum Corp., Taiwan Power Company and bulk commodity importers participating. They discussed matters concerning the organizing of the mission and their planned purchases in the United States.

According to the spokesman the mission plans to buy more than U.S.$200 million worth of soy beans, maize, wheat and other farm produce and more than U.S.$70 million worth of oil and steel refinery equipment, power generation equipment and other industrial products.

Besides making purchases in California, Texas, Indiana, Kansas and 12 other states and Washington, D.C., he said, the mission will also sponsor 10 seminars in investments in the Republic of China and the United States.

He said the mission is scheduled to depart Taipei 23 August and return home 27 September. The ROC has sent 11 "buy American" missions to buy an aggregate U.S.$7.8 million worth of American products since 1978.

CBC GOVERNOR DEFENDS HANDLING OF FOREIGN EXCHANGE

OW060433 Taipei CNA in English 0332 GMT 6 Jun 86

[Text] Taipei, 5 Jun (CNA)--The Central Bank of China [CBC] is handling the nation's foreign exchange reserves properly, CBC Governor Chang Chi-cheng said Thursday. "Security, profitability and liquidity have been CBC's main considerations in handling the foreign exchange reserves," Chang stressed.

He said the foreign exchange reserves, which total over U.S.$28.5 billion now, are deposited in some 100 foreign banks in the name of the Central Bank of China.

Chang made the remarks in answering interpellations from several legislators at a budget screening meeting of the legislative Yuan. Those foreign banks, mostly in the United States, Japan, England and West Germany are all listed among the 200 biggest banks in the free world, Chang said.

The legislators suggested that the nation use the huge foreign exchange reserves to purchase such other currencies as the Japanese yen and the Deutsche mark to prevent the possible loss caused by the drastic devaluation of the U.S. dollar. Most of the nation's foreign exchange reserves are now deposited in the foreign banks in the form of U.S. currency.

Chang said as the U.S. has been the nation's biggest trade partner, and the interest rates in the states are higher than those in other countries, the U.S. dollar will still constitute the biggest part of the nation's foreign exchange reserves.

He said the foreign exchange reserves are projected to earn the nation NT [New Taiwan] dollar 67 billion (about U.S.$1.7 billion) in interest income and in profits from trading of bonds and stocks in fiscal 1987.

As to the management of the foreign exchange reserves, Chang said that the government is now using this money to help state-run enterprises repay their foreign debts, grant loans to the private sector for the imports of daily necessities, raw materials and machineries, and make investments in public development projects so as to help stimulate the investment willingness here.

MINISTRY TO REMOVE TV, VTR IMPORT RESTRICTIONS

OW050405 Taipei CNA in English 0324 GMT 5 Jun 86

[Text] Taipei, 5 Jun (CNA)--The Ministry of Economic Affairs (MOEA) has approved the Industrial Development Bureau's (IDB) proposal to do away with export ration and local content ratio requirements for videotape recorders (VTRs) and color televisions in view of the imminent removal of import restrictions on the two products scheduled for 1 July.

The export ratio and local content ratio requirements were originally designed to protect the local VTR and color TV industries. With import restrictions lifted, such curbs become meaningless.

The import of components for color TVs will no longer be confined to the U.S. and Europe, while import duties and commodity taxes will be adjusted to reduce local manufacturers' production costs, the MOEA added.

Under current regulations, the local content ratio for VTRs and color TVs are both 55 percent, each VTR maker has its export ratio stipulations, and components for colot TVs have to be sourced from Europe and the U.S.

In related news, the IDB is considering stopping protection of locally-made picture tubes for color TVs. IDB Director Hsu Kuo-an voiced the possibility at a recent meeting with picture tube makers.

ECONOMIC AFFAIRS MINISTRY REPORTS ECONOMY GROWING 'STEADILY'

OW311455 Taipei CNA in English 1405 GMT 31 May 86

[Text] Taipei, 31 May (CNA)--Various statistical indexes show that the economy of the Republic of China [ROC] is steadily growing, the Ministry of Economic Affairs [MOEA] said Saturday.

The ministry noted that the ROC's two-way trade totaled U.S.$18.8 billion in the first four months of 1986, registering a 13.2 percent increase over the same period of last year.

The overall industrial production index stood at 134.76 points during the January-April period, increasing 8.23 points compared with the like period in 1985, the MOEA said.

Judging from the trade and industrial production indexes, the ministry added, the national economy has come out of the recession which started in late 1984.

According to customs statistics, the MOEA noted, the imports of capital goods in April alone had an 11.2 percent increase over previous months, showing that the demand for machinery equipment on the part of domestic manufacturers is on the rise. This trend will be helpful to the future economic development it said.

The ministry, however, warned that the continued increase of money supply is expected to impose strong pressure on commodity price hikes because the international oil prices have declined almost to the bottom and the booming exports will further increase this nation's excessive accumulated foreign exchange reserves.

EXECUTIVE YUAN SETS ECONOMIC GROWTH RATE

OW300529 Taipei CNA in English 0303 GMT 30 May 86

[Text] Taipei, 29 May (CNA)--The Executive Yuan has set the goal of annual economic growth in the Republic of China at an average of 6.5 percent until the year 2000. And it projects the per capita gross national product will climb to U.S.$13,395 in 2000, about 330 percent higher than the U.S.$3,142 registered in 1985.

The Yuan set the goals in a weekly cabinet meeting Thursday when it approved a plan entitled "Long-term Prospects for Economic Development in the Republic of China on Taiwan Covering the 1986-2000 Period." It was submitted by the Council for Economic Planning and Development [CEPD].

According to the long-term prospects, major goals of the economic development set for the years leading up to the year 2000 include:

--wholesale price hikes will not exceed an annual average of 3.5 percent;

--the average annual growth rates for various sectors are: agriculture, 1.5 percent; the manufacturing industry, 0.6 percent; and the service industry, 7.4 percent;

--the average annual growth rates for population, employment and laborers' productivity will be 1.1 percent, 1.9 percent and 4.5 percent respectively and the unemployment rate will not exceed 0.3 percent;

--the exports of goods and services will grow by an average 6.1 percent annually in real terms and their share in the real GNP will be lowered from 54.5 percent in 1985 to 51.6 percent; and

--the imports of goods and services will have an average 7.9 percent annual growth rate and their share in the real GNP will increase from 41.9 percent in 1985 to 51.2 percent, making exports and imports to be nearly balanced in 2000.

After the cabinet meeting, Yeh Wan-an, vice chairman of the CEPD, explained that the ROC ranked 16th among free world nations in terms of foreign trade volume last year and 11th in terms of exports. With these remarkable achievements, coupled with its geographically strategic position in the Pacific Basin, the country should have great potential to become a strong economic power in the world by the turn of the century, he said.

BANKS URGE NEW TAIWAN DOLLAR DEREGULATION

OW030405 Taipei CNA in English 0306 GMT 3 Jun 86

[Text] Taipei, 2 Jun (CNA)--Domestic financial and banking specialists Monday suggested that to stabilize the whole economic formation and balanced development the government should change its policy and deregulate gradually the new Taiwan dollar's exchange rate against the U.S. dollar.

The new Taiwan dollar has been pegged to the greenback for its exchange rate with only slight fluctuations. The Central Bank of China [CBC] had intervened in the foreign exchange market to maintain the stability of the new Taiwan dollar because most of this nation's exports are quoted in the American currency. they pointed out.

The CBC action is also to help domestic traders minimize their possible losses if the exchange rate changes drastically, they noted. They said, however, the large increase of capitals in the domestic money market, resulting from the CBC's buying of the U.S. dollar on the foreign exchange market, is expected to raise inflationary pressure.

Meeting the development as well as liberalizing and internationalizing the nation's banking system, the government has revised part of its existing foreign exchange policy. Among the changes, three banks have been authorized to manage investments and trust funds in the form of foreign exchange.

For the benefit of the national economy as a whole, they said, in the long-run, more imports and investments abroad should be encouraged.

BRIEFS

TEXTILE TALKS WITH U.S.--Taipei, 3 Jun (CNA)--Regarding the U.S. request that textile exports from the Republic of China, South Korea and Hong Kong over the next three years be frozen at the 1985 levels, the ROC-USA textile talks will not be held before the United States reaches agreement with South Korea and Hong Kong, respectively, Vincent C. Siew, director general of the Board of Foreign Trade, said Tuesday. He noted that the United States should not ask the ROC to be the first one to accept its request to further restrict textile exports because this nation has always been cooperative in line with the protectionist measures taken by the U.S. Government. The U.S. representatives had expressed their understanding of the basic ROC positions regarding the textile issue in the 26-28 May ROC-USA textile talks in Honolulu, Hawaii, Siew said. The second round of textile talks between the United States and South Korea is scheduled for 9-11 June and the second round USA-HK talks will be held in late June, he added. Siew said the U.S. representatives have promised that the ROC textile exports will not be subject to unilaterally discriminate quota restraints set by Washington. [Text] [Taipei CNA in English 0253 GMT 4 Jun 86 OW] /9738

'LARGE-SCALE' TARRIFF CUTS--Taipei, 1 Jun (CNA)--A ranking official with the Ministry of Economic Affairs [MOEA] has said that in view of the low investment willingness here, the MOEA has decided to discuss with the Ministry of Finance how to make large-scale tariffs cuts on the imports of raw materials so as to accelerate the nation's economic recovery. The official, who preferred anonymity, pointed out that while the nation's exports in March and April showed rapid growth with a total amount of over U.S.$6 billion, the imports registered less than U.S.$4 billion. The continuing expansion of foreign trade surplus will not only heighten the pressure the nation is bearing because of the increasing foreign exchange reserves but will also force foreign nations to take protectionist measures, he said. The official attributed the decrease of the volume of imports to the weakness in prices of crude oil and bulk goods in the world market and the low investment willingness in the nation. "The era of paying-attention-to-exports-only will be over soon. The government should, from now on, pay equal attention to the imports", he stressed. [Text] [Taipei CNA in English 0255 GMT 2 Jun 86 OW] /9738

JAPANESE INVESTMENT SOUGHT--Taipei, 3 Jun (CNA)--Plagued by manufacturing cost increases brought about by the strong Japanese yen, more and more Japanese companies are coming to Taiwan to inquire about local investment incentives, according to the Investment Commission, Ministry of Economic Affairs (MOEA). According to the commission, the electronics industry accounts for most of the inquiries, followed by the machinery industry, metal industry, and chemical industry. In addition to offering exhaustive replies to Japanese inquiries, the commission is also urging Japanese company representatives to visit local processing and industrial zones. Most Japanese companies are impressed with the island's diligent labor force and export incentives, and some even cancel their scheduled visits to other Asian countries, a commission spokesman added. Meanwhile, ROC trade offices stationed in Japan are inviting more companies to visit Taiwan. [Text] [Taipei CNA in English 0330 GMT 3 Jun 86 OW] /9738

PROFESSOR VIEWS PROSPECTS FOR STUDY OF ECONOMICS

Part I of Article

HK021221 Beijing JINGJI CANKAO in Chinese 20 May 86 p 6

[Article by Professor Li Yining (0632 0110 1337) of Beijing University: "Prospects for the Study of Economics in China"--part 1 of 2]

[Text] I. The Challenges Facing Economics

1. The Chinese economy is in a period of transformation from an old structure to a new one and the study of economics cannot remain at the original level. The historic mission of the economic circles is to adhere to and develop Marxism in light of China's practical conditions and to raise theoretical studies to a new level.

2. In the study of economics, outdated concepts will not voluntarily disappear. There is nothing serious in this. Before long, nobody will like to read articles spreading outdated concepts or to listen to lectures publicizing outdated concepts. We should concentrate on studying and solving new problems. This is the main area in which we should concentrate our efforts.

3. Only by ceasing to confine their tasks to explaining existing policies is it possible for economics workers to make breakthroughs in their studies and to make new headway in their theoretical studies.

4. A serious defect in the study of socialist economic over the years is that we have not paid sufficient attention to analyzing economic operations. For this reason, an urgent task facing the study of socialist economics is to establish our own scientific theory on socialist economic operations. This is precisely the basic contents of our socialist economics.

II. The Social Responsibility of Economics Workers

5. If we do not study new problems in Chinese socialist economy, who will? If we do not explain the new phenomena that have occurred in Chinese economy, who will? If we do not establish new branches of science, who will? We should have the spirit of "not passing to others what we

are called upon to do." It can be predicted that 1 decade from now a number of outstanding economists representing China's new economics will emerge from people between 30 and 40 years of age today. People our age will play a role as transitional figures serving as a link between past and future. Assisting young and middle-aged economic workers is a task history has entrusted to us.

6. It is necessary to have courage in developing Marxist economics. We should free our minds of apprehension so long as it contributes to socialist construction. Problems that have not been explained in classical works may be raised for discussion. If, in light of the new conditions, it is necessary to restudy problems that have been discussed in classical works, we may also air our views. We may also use new methods or terms that have never been used in classical works so long as they are more or less scientific. We should not confine ourselves to scholastic studies.

7. Economics workers have the duty to analyze and to comment on policies. Silence on the part of economic circles constitutes an incalculable loss to the cause of socialist construction. Naturally, it is necessary to discuss current economic policies on an item-by-item basis and on different scales and to pay attention to the social effect of the policy discussion. In holding a policy discussion, it is necessary to combine motive with effect.

8. It is necessary to make a scientific analysis on the results achieved by foreign countries in the study of economics. It is incorrect to indiscriminately affirm or negate them lock, stock, and barrel. It should be stressed here: We should proceed from China's practical conditions in everything; we should not mechanically copy them even if they can be taken as a reference. Our objective is to learn from the strong points of various schools of thought in order to build up our own economic science.

III. The Vitality of Economics Lies in Bringing Forth New Ideas

9. Bringing forth new ideas in economics refers not only to making some breakthroughs and achieving some results in the study of applied economics, but, what is more important, to blazing new trails in the study of theoretical economics. This is because theoretical economics is the basis of applied economics.

10. To blaze new trails in economics, we should rely on collective wisdom. However, collective wisdom can be brought into full play only in an academic environment, where different schools of thought contend. A problem in economics can finally be solved only after repeated discussions and repeated confrontations of academic views. In this sense, all of us should participate in the contention and contribute our share in blazing new trails for socialist economics.

11. New concepts of socialist economics are often regarded as heretical at first. There is nothing strange about this. The heart of the matter does not lie in whether the new concepts were at first regarded as heretical but in whether they can later stand the test of practice. In fact, all theses of economics were regarded as hypotheses when they were first set forth. Without these hypotheses, it would be impossible to make any headway in the study of economics. Economics always advances in the course of constantly setting forth hypotheses and testing and verifying them.

12. In order to achieve new breakthroughs in the study of economics, in addition to expanding their range of knowledge and enhancing their ability to analyze problems and to express their ideas, what is more important to economics workers is to engage in independent thinking. If all economics workers are good at independent thinking and constantly kindle "ideological sparks," we can develop a contingent of high-quality research workers in economics.

IV. The Development of Economics Needs a Favorable Academic Environment

13. The development of economics needs a favorable academic environment and so does the development of all branches of learning, including literature, philosophy, other social sciences, and all natural sciences. Without a universally favorable academic environment, it would be impossible for economics to develop in isolation andfor economics workers to "fight in isolation." We hope that a favorable academic environment will be created for science as a whole.

14. There is no need for economics workers to give serious attention to critical views that are not raised in a realistic manner. However, it is necessary for the departments in charge of ideological matters to create a favorable academic environment for the contention of economics. The practice of socialist construction will give a fair judgment of the ongoing academic contention. In the study of economics, it is necessary to prevent the following phenomenon: Some people neither pay attention to nor study practical problems at ordinary times. They are only keen on finding ready answers from books. However, when they note some new concepts in the course of discussion, they will copiously quote authoritative works as if they were the most qualified persons to criticize those studying practical problems. This is obviously an abnormal phenomenon, which we wish will not happen in the future.

15. All people are equal in the study of economics. All experts, authorities, and leaders join in the discussions in the capacity of academic researchers. They should respect science and submit themselves to the truth. Only in this way will there be hope for the prosperity of economics.

16. Those who achieve successes in the study of economics are not necessarily professional economics workers. Amateur economics workers and those who study other specialties but who are interested in economics

will join the ranks of economics researchers. We should create a favorable academic environment for their participation in economics studies and not lightly censure them as "failing to attend to their proper duties." It is precisely the duty of all builders of socialism to offer advice, put forward proposals, and think of ways for socialist economic construction. Professional economics workers should never have the inclination of closed-doorism. In both history and practical life, are there not sufficient examples of how people who have never received professional training in economics have become well-known economists?

Part II of Article

HK021239 Beijing JINGJI CANKAO in Chinese 21 May 86 p 6

[Article by Professor Li Yining (0632 0110 1337) of Beijing University: "Prospects for the Study of Economics in China"--second and final part]

[Text] V. The Knowledge Composition of Economics Workers

17. Economics basically develops simultaneously with other branches of learning and the overlapping and infiltration between different branches of learning are being conducted at an increasing pace. New fields of economics studies have developed on the border areas between economics and other branches of learning. Economics workers should be concerned about the latest developments in other branches of learning, pay attention to absorbing the latest achievements in other branches of learning, and try to explore and open up new channels of research on these border areas.

18. The knowledge composition that economics workers should possess are inseparable from the tasks facing economics in each era. It is necessary to have a correct understanding of this knowledge composition. A common understanding is that economics workers should have knowledge of natural sciences, master calculation skills, receive training in statistics, and so on. This is a correct understanding. However, we should not neglect that even economic theories likewise face the problem of knowledge renewal. If we pay attention only to the renewal of economics methods to the neglect of the renewal of economics theories, it will be impossible for us to achieve greater successes in our research.

19. In the study of economics, various methods always complement one another. A breakthrough in the methods of studying economics implies: 1) We should be good at choosing research methods according to the research topics and at combining various methods so that we can reach a new level in the use of existing methods. 2) We should be good at introducing certain methods in other branches of learning so that they can become new methods of studying economics.

20. Constant changes in knowledge composition make it entirely possible for a new generation of economics workers to discover the weak links in the research work of the older generation of economics workers and to ultimately surpass the older generation of economic workers. Economics attains a new plane in exactly this way.

VI. The Unity of the Standard Nature [gui fan xing 6016 5400 1840] and the Positivist Nature [shi zheng xing 1395 6086 1840] of Economics

21. As the science of social enlightment, economics tells people how to judge the right and wrong of economic matters. As the science of social designs, economics tells people how to attain the set objectives. Viewed from social enlightment and social designs, the standard nature and the positivist nature of economics always form a unity.

22. It is impossible to interchange positivist studies and standard studies in socialist economics. In the past, we paid attention neither to positivist nor to standard studies. It was precisely because we did not attach importance to standard studies that we failed to differentiate between right and wrong and made wrong judgments. The result was that what should not have been affirmed were lauded to the skies and that some originally correct things were "thoroughly refuted." It can thus be seen that overlooking the standard studies of economics will cause greater losses to socialist economic construction.

23. The study of economics can be divided into different levels. At the lower levels, positivist studies account for a larger proportion. At the higher levels, however, standard studies account for a larger proportion.

24. "Economics papers" consisting of 50 percent of quoted passages "with quotation marks" and 50 percent of others "without quotation marks" no longer appeal to readers. In the future, academic periodicals should publish articles that contain the writers' original ideas or in which the writers excel themselves in either standard or positivist studies. This will be a literary style of China's economics. The development of this literary style depends on the concerted efforts of us all.

VII. Prospects for the Study of Economics in China

25. Only by basing our work on our own country and the reality is it possible for us to make breakthroughs and to blaze new trails in the socialist economics.

26. Various schools of socialist economics holding different academic views will emerge under the guidance of Marxism. None of the schools should have a sectarian bias. Those who approve the basic academic concepts of this school should be regarded as a member of this school. Schools of thought should not close themselves to the outside world.

27. In the field of socialist economics, different schools emerge and gradually develop in the course of academic contention. When a school first emerges, it is impossible to have very perfect academic concepts. However, it must have some new concepts, adopt new methods, and put forward new ideas. Perfection of this school will be left to the joint efforts of the other members of the school. In this way, all schools will not remain at the initial levels but will forge ahead; in socialist economics

as a whole, a situation of constant progress will also emerge. That is to say, contention among different schools of thought will be conducted at increasingly higher levels. This is an indication that the study of economics in China is flourishing.

28. Different schools of thought will exist for a long time. If, in the future, some people hold that all these schools have deficiencies or that it is possible to coordinate various schools of thought, another new school will then come into being. This has happened in the history of economics theories and will also happen in China's economics circles. It can be predicted that provided there is a favorable academic environment and a contingent of high-quality economics research workers, different schools will not only emerge in China's economics circles but some new schools will continue to emerge. The study of socialist economics will go deeper and the level of economics in China will also become higher. We look forward to the arrival of this prospect.

NATIONAL POLICY AND ISSUES

REGIONAL ECONOMIC DEVELOPMENT CLASSIFICATION DISCUSSED

Beijing JINGJI KEXUE [ECONOMIC SCIENCE] in Chinese No 3, 20 Jun 85 pp 52-55

[Article by Feng Shixin [7458 0013 2450] of the Xian Jiaotong University: "On the Issue of the Division of Regional Types in Economic Development"]

[Text] Since the nation's founding, we have roughly classified our country's regional types in economic development as follows: In the 1950's, in the First 5-Year Plan and in Comrade Mao Zedong's report "On the 10 Major Relationships," the regional types in the economic development of our country were classified into the "coast" and the "hinterland." The policy on correctly handling the relationship between coastal industry and the industry of the hinterland was also put forth. This could be referred to as a "binary method." Later, some people proposed the drawing of an oblique line from Aihun in Heilongjiang Province to Tengchong in Yunnan Province. East of the oblique line were the "developed regions" and west of the oblique line were the "underdeveloped regions." This could also be referred to as a "binary method." In the "Sixth 5-Year Plan" approved by the Fifth Conference of the Fifth NPC, the regions were classified into the "coast," "the hinterland" and "minority nationality and underdeveloped region." This could be called a "ternary method." Comrades Zhou Zhiqun and Liu Jiajin published an article entitled "Several Issues on the Development of the Productive Forces in the Underdeveloped Regions in Our Country" in the second issue of the 1984 "Economic Science." In the article, the authors maintained that the above classifications "overemphasized the regional concept," and "failed to accurately represent the reality of the level of development of the productive forces of the various regions." As a basis for classification, they advocated the "establishment of a comprehensive index system which could represent the level of development of the productive forces in various respects." Prior to the establishment of this index system, assessment should be carried out on the following important indices: the per-capita gross value of social output, the social labor productivity, the gross value of social output on every square km of land and the situation of financial revenue and expenditure of the selected regions. Since our country lacked the statistical data on the regional per-capita gross value of social output, the authors therefore advocated using the per capita gross value of industrial and agricultural output (GVIAO) as the basis for classifying the regional types in economic development, and supplementing and revising the data on the basis of the other three indices. Taking the per capita GVIAO throughout the country in 1981 as the basis, they carried out readjustment, and categorized those provinces, municipalities and autonomous regions with a regional per capita GVIAO of over 1,000 yuan as "developed regions," those between 600 to 1,000 yuan as "average developed regions" and those under 600 yuan as "underdeveloped regions." The results of classification according to this index were as follows: There were 7 provinces, municipalities and autonomous regions throughout the country which were categorized as "developed regions," only 6 categorized as "average developed regions" and 16 categorized as "underdeveloped regions" (including Hunan, Fujian, Shaanxi, Jiangxi, Henan, Anhui, and Sichuan provinces). Comrades Zhou Zhiqun and Liu Jiajin put forth the necessity of "establishing a comprehensive index system which can represent the level of productive forces of the various aspects" and use it as the basis for classifying the regional types in economic development. Although this has inspired us positively, yet their "new ternary method" embraces many problems which merit discussion.

How should we classify regional types in economic development? I feel that the most fundamental and foremost task is to clarify the guiding ideology in the classification, i.e., the goal of and indication for classification. The fundamental goal of the classification of regional types in economic development is to rationally deploy productive forces in the various regions throughout the country. This means that we must conduct a practical and realistic estimate of the productive forces which have been formed in different regions in our country within a definite period of time. In this way, the state can conveniently proceed from reality, implement classified guidance in economic construction, formulate the strategies for economic development of different regions as well as the principle, policies and measures for realizing the strategies, rationally deploy productive forces within the national scope, and promote an upsurge of the entire national economy. On the basis of this guiding ideology, I feel that: 1) The indication for the classification of regional types in economic development should be the productive forces which are formed in different regions within a definite period of time, and not other criteria (such as the extent of wealth or the extent of economic results of different regions). 2) With the development of economic construction, the classification of regional types in economic development must also change with the changes in the development of the situation of deployment of the productive forces, i.e. the classification of types must accurately represent the objective reality of the changes in the development of the productive forces. 3) The result of the classification of regional types in economic development must provide the scientific basis for guidance in economic construction.

Proceeding from the abovementioned guiding ideology and classification principle, how should we assess these methods of classification? I feel that the "binary method" conformed to the objective reality of the deployment of productive forces in our country in the early days of the nation's founding, and once played a positive role in guiding our country's economic construction. The conditions of the deployment of productive forces which the old China had left behind were as follows: 70 percent of our modern industry was concentrated on the eastern coastal region, which constitutes less than 12 percent of our land. Inversely, the gross value of industrial output of the vast western region, 68 percent of the land in our country, only constituted 9 percent of the nation's gross. Most of the railways and highways were built along the eastern coastal region and in the northeast region, while communications in the southwest and northwest regions were inaccessible. In light of this situation, at the beginning of the First 5-Year Plan, the state put emphasis on strengthening the construction of the hinterland while fully utilizing the industries along the coast. More than half of the capital construction funds were invested in the development of the hinterland. In the gross amount of capital construction investment throughout the country, the percentage of investment in the hinterland in the various periods has varied: 47.8 percent in the "First 5-Year Plan" period; 53.7 percent in the "Second 5-Year Plan" period; 58 percent between 1963 and 1965; 66.8 percent in the "Third 5-Year Plan" period; 53.5 percent in the "Fourth 5-Year Plan" period; and 49.5 percent in the "Fifth 5-Year Plan" period. After 30 years of construction, the value of industrial output of the hinterland has increased by more than 40 times. Its proportion in the gross value of industrial output throughout the country has increased from 28 percent in the early days after Liberation to 36 percent. By 1978, the proportion of the fixed assets owned by the state-owned industrial enterprises in the hinterland increased from 27.1 percent in 1952 to 53.6 percent of the nation's total. Currently, the industrial fixed assets of the two large regions of the southwest and northwest as well as Hunan, Hubei, Henan and Shanxi provinces constitute more than one-third of the gross amount of industrial fixed assets of the whole country, and the gross value of industrial output of these regions constitutes one-fourth of the nation's gross. In the railway operation mileage throughout the country, the southwest and northwest regions have increased their percentage from 5.5 percent in 1949 to 24.8 percent in 1979. In the highway operation mileage throughout the country, the southwest and northwest regions have also increased its percentage from 24.2 percent in 1950 to 31.9 percent in 1979. The above data shows that, after 30 years of construction, great changes have taken place in the deployment of our country's productive forces. Thus, if we continue at present to classify the country into the "coast" and the "hinterland" (or into "developed region" and "underdeveloped region" according to the "new binary method"), then, we will not be able to represent the objective reality of the deployment of our country's productive forces at the present stage, and will not be able to meet the needs of guiding our economic development still further in the future.

The "Sixth 5-Year Plan" has classified our country's regions in economic development into "coastal region," "hinterland region," and "minority nationality and underdeveloped region." Different guiding principles have also been put forth for different regions: The coastal region must bring into full play its special strength and motivate the hinterland, must develop high-grade, precision and advanced industries, and must actively expand foreign trade. The hinterland region must speed up its energy, communications and raw materials industrial construction in support of the coastal region, must restructure, reorganize and assemble the present machine-building industry, develop consumer product industry in a planned manner, and bring into full play the potentials of agricultural production. The minority nationality and economically underdeveloped region must bring into play its superiority in agriculture and animal husbandry. In light of the characteristics of its resources, it must strengthen industrial construction in a planned manner. We must continue to support it in terms of financial resources, material resources and technological strength. This manner of classification of regional types in economic development and the guiding principle are suitable to the objective reality of our country's current deployment of productive forces and is favorable to the implementation of classified guidance in economic construction. It is thus correct. We can further prove its correctness in the following respects:

First, in terms of historical development, China's development began in the middle reaches (inland) of the Huanghe and Changjiang. With the development of a commodity economy, in particular with the invasion of foreign capitalism, the coastal economy gradually became colonialized or semicolonialized. However, the coast has more productive forces in modern industry and communications and transport undertakings, and takes the lead in the nation in the level of development. Comparatively speaking, the level of productive forces of the hinterland is backward. Moreover, due to restrictions by all kinds of factors, including social system, population and communications, the frontier region has all along remained underdeveloped. On this basis, after 30 years of emphasis on strengthening hinterland construction since Liberation, objectively, the regional differences in the extent of the development of the productive forces of the "coastal," "hinterland" and "minority nationality and underdeveloped" regions have become more conspicuous.

Second, in terms of the present condition of the development of productive forces, these three regions all embody their own striking characteristics. The coastal region has a better industrial foundation, a higher level of production technology, a higher level of business management and better economic results. However, it is densely populated and suffers from an energy shortage. There are more restrictive factors for further economic development. The hinterland has more newly-built industries and more adequate energy and raw materials supply. However, its management level is low and its economic results are poorer than the coastal region. There is greater potential for agricultural production. The minority nationality and underdeveloped region has a smaller population, a vast land and abundant natural resources. However, it has little modern industry and poor transport facilities. It must create the conditions for further development.

Third, in terms of the formulation of strategies for economic and social development, it is also necessary to classify the regions into three types. The coastal region not only has high economic standards, but also has the geographical advantage to conveniently carry out economic and technological exchanges with foreign countries. Furthermore, it has established more external economic relationships in the past as well as accumulated experiences in that respect. Different policies should obviously be adopted for the hinterland region where there are more newly-built industries and potentials which have not yet been fully developed. Needless to say, special policies must be adopted for the development of the "minority nationality and underdeveloped region."

Comrades Zhou Zhiqun and Liu Jinjia put forth the "new ternary method" of classifying types in economic development on the basis of a series of indices with the per capita GVIAO as the key. I feel that this is worth discussing. The primary reasons are as follows: First, their disagreement with the "one-sided emphasis on the regional concept" in classifying regional types in economic development is worth studying. 1) Classifying regional types in economic development is an issue involving the study of the deployment of productive forces. It attempts to study the distribution of productive forces in various regions in our country at the present stage. We cannot depart from the "regional concept" in considering the issue. 2) The geographical characteristics of a certain region have great bearing on the condition of the productive forces of that region. 3) In terms of the implementation of the principle of rational deployment of productive forces, we must carry out industrial production near the raw material and fuel producing areas and the sales markets, implement cooperation among specializations, speed up the development of economically backward regions, and implement the nationality principle and the national defense principle. These are all closely related to the regional characteristics of different regions.

Second, it is not scientific enough to simply use such indices as per capita GVIAO, social labor productivity, the gross value of social output of our land, and financial revenues and expenditures, to explain the level of productive forces of different regions and to use them as the criteria for classifying regions into developed and underdeveloped reigons. These indices (gross output value, labor productivity, financial revenues and expenditures, and so on) represent the results of the roles played by certain productive forces, but are not equivalent to the productive forces which have been formed. They may represent the level of economic development, economic results and extent of wealth attained by different regions, and are meaningful to assessing the economic work--good or bad--of different regions. However, from the angle of the study of the deployment of productive forces, they cannot fully represent the condition of the productive forces which have already been formed in the different regions. We know that productive forces include the human element and the material element. In terms of the condition of regional productive forces, the human element is manifested in the number of laborers, in particular, in the education, scientific and technological strength which a region possesses and the cultural, scientific and technological level of the laborers of that region. Leaving aside the controversy that the object of labor is an important material element, it is generally recognized that the condition of labor materials (technological equipment) is an indication of the level of development of the productive forces. Thus, the rational indices which directly represent the condition of the productive forces which have been formed in the various regions should be the conditions of the productive capacities or fixed assets (including the productive capacities in industry and agriculture, the communications and transportation factors, and so on) which have been formed, the educational, scientific and technological facilities which have been formed and their corresponding capabilities, as well as the cultural, scientific and technological levels of the laborers. Herein exists the difference between the productive capacities which have been formed and the results of the actual roles played by certain productive capacities. Currently, one problem in our country's economic development lies in the following: After Liberation, the newly-increased productive capacities and education and scientific and technological strengths of the hinterland region have been developed to a great extent. However, with the restructuring of the economic structure, the shortcomings in the management system, and relatively backward business management, the productive capacities which have been formed in these regions have not been brought into full play. Thus, the

GVIAO, labor productivity and financial revenues of these regions are still very low. To solve these problems, we must rely primarily on restructuring, reform and rectification to improve economic results and bring into full play the role of the productive capacities which have been formed. The minority nationality and underdeveloped region, however, must rely primarily on increasing new productive capacities in order to carry out new development.

Third, using the per capita GVIAO as the criterion for classification, we may easily confuse those regions with different types of economic development. This will be unfavorable to the formulation of regional economic development strategies and classified guidance in economic construction. This is because this classification method is calculated using the total population of different regions as the base figure. However, in our country, the differences in the total population of different provinces and regions are too great. In accordance with the third national census: In 1982, the total population of Sichuan Province was 99.71 million people, with a population density of 176 people per sq km; the total population of Tibet was only some 1.89 million people, with a population density of only 1.6 people per sq km. The total population of Sichuan was 53 times that of Tibet, and the population density was 118 times that of Tibet. The differences in the total population of different provinces and regions can be from several times to more than 10 times, while the population density can be from more than 10 times to more than 100 times. Under such a circumstance, using the per capita GVIAO as the "most important" criterion to gauge the level of development of the productive forces, we will classify those provinces and regions with obvious and immense differences in the level of development of their productive forces as one regional type. For instance, we will classify both Tibet and Sichuan as "underdeveloped regions." Can this "accurately represent the reality of the level of development of the productive forces in the various regions"? In their article, Comrades Zhou Zhiqun and Liu Jinjia discussed the "handling of the problems which currently exist in the development of productive forces in the underdeveloped regions." They maintained that the underdeveloped regions are at the rudimentary stage of the development of the productive forces. Their poor economic results are the crux of the development of the productive forces of the underdeveloped regions. Besides geographical location, science and technology and other factors, the weakness in the infrastructure such as communications and transportation is a primary reason why the economic results are poor and the profits are low. This analysis is no doubt correct with regard to the "minority nationality and underdeveloped region" pointed out in the "Sixth 5-Year Plan." However, this is obviously inaccurate with regard to the so-called "underdeveloped regions" as indicated by their "new ternary method," which includes 16 provinces and regions constituting more than half of the country's territory. The purpose of classifying regional types is to provide the basis for classified guidance in economic construction. What realistic significance therefore can the classification by comrades Zhou Zhiqun and Liu Jinjia have in guiding our country's economic construction? In the economic construction (in particular, in the development of the great northwest and the great southwest regions), are the positions and roles of those 16 provinces and regions which are included in the so-called "underdeveloped regions" the same? Toward these many so-called "underdeveloped regions," can the state adopt the "supportive" policy stipulated in the "Sixth 5-Year Plan" on the "minority nationality and underdeveloped region" or the "special policy" which comrades Zhou Zhiqun and Liu Jinjia proposed in their article? This is obviously impossible.

ZHEJIANG GOVERNOR PRESENTS SEVENTH 5-YEAR PLAN REPORT

OW072300 Hangzhou ZHEJIANG RIBAO in Chinese 15 May 86 p 1

[Report on the Seventh 5-Year Plan of Zhejiang Province, delivered by Zhejiang Provincial Governor Xue Ju on 5 May 1986 at the Fourth Session of the Sixth Provincial People's Congress--passage within slantlines published in boldface]

[Text] Deputies:

The main item on the agenda of the current session of the Sixth Provincial People's Congress is to examine and approve our province's Seventh 5-Year Economic and Social Development Plan. On behalf of the provincial people's government, I now deliver a report on this plan for your examination and approval.

The work of drafting our province's Seventh 5-Year Plan has lasted for more than 2 years. As the State Council arranged, the provincial people's government organized all localities and provincial departments to conduct extensive investigations and studies, make estimates, and acquire opinions from people of all circles with regard to the targets and tasks of the Seventh 5-Year Plan. Then, after repeated revisions, a preliminary draft of the Seventh 5-Year Plan was drawn up. In late April the Zhejiang Provincial CPC Committee called an enlarged plenary meeting to seriously discuss this preliminary draft, and many important suggestions were made at that time. The draft plan now distributed to you for examination and approval was finalized after being revised according to the suggestions received from various quarters.

I will first report on the work done in implementing the Sixth 5-Year Plan. Then I will give some explanations on the questions of the basic tasks of the Seventh 5-Year Plan and the principal economic work, economic reform, and building of spiritual civilization during this period.

I. Implementation of the Sixth 5-Year Plan

Guided by the line, principles, and policies formulated since the 3d Plenary Session of the 11th CPC Central Committee and through the joint efforts of the people throughout the province, we have fulfilled or overfulfilled the main tasks and targets set in our Sixth 5-Year Plan. We may say that the period of the Sixth 5-Year Plan was one marked by the most vigorous economic construction and social development and the most prominent changes in our province since the founding of the People's Republic.

During the Sixth 5-Year Plan our province's economy showed sustained and steady development at a relatively high rate. From 1980 to 1985 our province's gross value of industrial and agricultural production rose from 30.1 billion yuan to 67.8 billion yuan, while the domestic income rose from 15.8 billion yuan to 35.7 billion yuan, both more than doubling and exceeding the planned targets by over 60 percent. Increases of such magnitude were never experienced in any of the previous 5-year plans.

A breakthrough was made in the development of agriculture. The province-wide agricultural output value for 1985 (including industrial production at and below the village level) reached 23.4 billion yuan, more than double the 1980 amount. The average annual growth rate was 15.7 percent for these 5 years. Output of all agricultural products increased by a wide margin. Compared with the records for the period of the Fifth 5-Year Plan, the average annual output of grain increased from 13,869,000 metric tons to 16.3 million metric tons during the Sixth 5-Year Plan, cotton from 66,000 metric tons to 95,000 metric tons, rapeseed from 189,000 metric tons to 359,000 metric tons, the number of pigs slaughtered from 10.29 million head to 12.38 million head, and aquatic products from 800,000 metric tons to 910,000 metric tons. The amount of timber reserves in the province also exceeded that during the Fifth 5-Year Plan.

Village and town industries made great headway. The value of these industries' total output reached 20.7 billion yuan in 1985, showing a more than fourfold increase in 5 years. Meanwhile, there was a significant change in the rural production structure, in that the rural economy was no longer based on farming alone, but embarked on the track of all-around development of farming, forestry, animal husbandry, sideline production, fisheries, and comprehensive operations in agriculture, industry, and commerce.

Industrial production continued to develop. The province's total industrial output value (excluding industries at and below the village level) reached 44.4 billion yuan in 1985. This was 1.36 times more than in 1980 and pushed our province from 12th to 7th position in the country in terms of industrial output value. The planned targets were fulfilled or overfulfilled for most of the major industrial products. From 1980 to 1985 the annual output of electric power rose from 8.1 to 13.2 billion kwh, steel from 390,000 to 540,000 metric tons, cement from 2.28 to 8 million metric tons, and chemical fertilizers from 490,000 to 520,000 metric tons. During this period, output of cotton yarn, cloth, and woolen fabrics all doubled, while production of television sets, refrigerators, washing machines, and other household electric appliances increased from over a dozen times to several dozen times. In the meantime, relatively big progress was made in transportation, postal, and telecommunication services. In 1985 the transportation departments in our province transported a total of 25.6 billion metric ton-kilometers of cargo, up 34 percent compared with 1980. The total business volume of postal and telecommunication service was close to 200 million yuan, more than double that of 1980. While production rose steadily, economic efficiency was raised to a fairly big extent. Compared with 1980, labor productivity at industrial enterprises owned by the whole people and operating with independent accounting systems rose 36 percent in 1985, average energy consumption for each 10,000 yuan of industrial output value dropped 33 percent, and the volume of tax revenues and profits created by industrial enterprises included in the budget increased 36 percent.

Considerable achievements were made in capital construction and technological transformation. In the 5 years, a total investment of 7.7 billion yuan was made in capital construction by units owned by the whole people, a 72-percent rise compared with the investment made during the Fifth 5-Year Plan. Thirty-one big and medium-sized projects were completed. The investment in technological upgrading and transformation of enterprises was 4.1 billion yuan, four times more than during the period of the Fifth 5-Year Plan. This upgrading and transformation investment accounted for 33 percent of the total investment in fixed assets, compared with 15 percent for the Fifth 5-Year Plan period. Due to the investment made in capital construction and in technological upgrading and transformation, the amount of fixed assets of industrial enterprises increased by 4.6 billion yuan. This additional value was equivalent to 68 percent of the original amount of fixed assets of state-owned industrial enterprises in our province at the end of 1980. Meanwhile, remarkable improvement was noted in the technological level of a number of trades and enterprises.

Financial revenue increased annually and reached 6 billion yuan in 1985. During the 5 years, the average annual increase was 600 million yuan. This not only boosted our province's economic strength but also contributed to the fundamental improvement of the financial and economic situation in our country. As for expenditures, the total for the 5 years was 12.4 billion yuan. Expenditure for agriculture was 1.4 billion yuan, accounting for 11 percent of the total amount of expenditure, and operating expenses for science, education, cultural, and public health undertakings were 3.7 billion yuan, accounting for 29 percent. In the 5 years, subsidies given to people for daily needs, including in the form of grain, cooking oil, meat, and eggs, totaled approximately 4 billion yuan.

Relatively big progress was made in our scientific, technological, educational, cultural, and public health undertakings. In the 5 years, successful results were achieved in 3,329 scientific research projects. Of the scientific research projects receiving awards in the first 4 years, 25 won state invention awards and 40 won state advanced-technology awards. Moreover, the wide application of scientific and technological achievements and the development of a mass technological innovation campaign produced fairly good economic results and social benefits. Spending for education was 2.1 billion yuan, double the amount for the Fifth 5-Year plan. The number of institutions of higher education increased from 22 to 35, and 51,300 people graduated from such institutions in the 5 years, or 2.37 times more than the number of graduates during the Fifth 5-Year Plan. Preliminary adjustment was made in the secondary educational structure, while rapid progress was made in developing vocational and technical education. Primary education was popularized in 71 counties (districts) and cities of our province. Various forms of adult education developed on a wide scale. The quality of school education was further raised, and conditions for running schools improved step by step. Literary and art works and the performing arts all showed improvement in quality and produced outstanding results which were well received by the people. New achievements were made in broadcasting, film, television, press, and publication work. Mass athletic activities developed further. A total of 406 gold medals were won in international and domestic sports contests. Conditions for public health and medical work improved gradually, and new progress was made in controlling endemic diseases. One-third of the rural population had access to running water. Family planning work achieved remarkable results. As of 1985, the province's natural population growth rate had declined to 6.56 per 1,000.

A good start has been made in opening to the outside world. During the Sixth 5-Year Plan period, we imported 585 pieces of technology and equipment, worth $300 million, and 72 Chinese-foreign joint ventures and cooperative enterprises registered with the provincial administration of industry and commerce. We made new progress in foreign trade. In 1985 alone, the province's export trade volume reached $940 million, overfulfilling the target of the Sixth 5-Year Plan by 42 percent. We also greatly developed tourism. During the Sixth 5-Year Plan period, foreigners, overseas Chinese, and Hong Kong and Macao compatriots who visited Zhejiang increased by more than 200 percent compared with the Fifth 5-Year Plan period, and our foreign exchange earnings from tourism exceeded $80 million.

Both our urban and rural markets were prosperous and brisk. In 1985, commodity retail sales in the province amounted to 19.7 billion yuan, more than double the 1980 amount, and the value of commodities purchased by state commerce and supply and marketing cooperatives increased by 52 percent over 1980. There were 630,000 individual craftsmen's and traders' households in the province in 1985, 19 times the number in 1980. Country fairs were held in urban and rural areas across the province, with trade transactions amounting to 4.4 billion yuan in 1985, up 260 percent from 1980.

With the development of production, the people's living standards improved remarkably; the improvement during the Sixth 5-Year Plan period was the biggest since the founding of the People's Republic. A sample survey of urban worker and staff households showed an average per-capita income of 839 yuan in 1985, a 9-percent average annual increase of income over the past 5 years (after allowing for the rise in commodity prices). The per-capita net income of peasants in 1985 was 548 yuan, with income increasing at an average annual rate of 17.7 percent over the past 5 years. New houses completed during the 5 years totaled some 23 million square meters of floor space in urban areas, and 160 million square meters in rural areas. Housing for both urban and rural people improved. During the 5 years, jobs were given to 560,000 people in urban areas, and improvement was made in the longstanding situation in which it was difficult for urban youth to find jobs.

During the Sixth 5-Year Plan period, we stepped up the building of socialist spiritual civilization while paying attention to building material civilization. In addition to actively developing culture and education, we strengthened and improved ideological and political work. We comprehensively publicized the line, principles, and policies laid down since the 3d Plenary Session of the 11th CPC Central Committee. We resolutely repudiated the erroneous theory and practice of "taking class struggle as the key link," and consolidated and developed the political situation of stability and unity. We firmly shifted the stress of our work to socialist modernizations and energetically advocated the pioneering spirit of reform and development, thus laying the ideological foundation for restructuring the economy and the economic development of both urban and rural areas. The launching of the "five stresses, four points of beauty, and three loves" movement and the campaigns to build civilized units and learn from PLA heroes and model persons brought about new changes in the people's mental attitude. Many advanced persons and advanced units emerged on all fronts and in all professions and trades. We stepped up education in the socialist legal system and popularized legal knowledge. We made remarkable achievements in combatting serious crime, gradually reduced crimes, and noticeably improved public order. We intensified our efforts to combat serious economic crimes. All this created a good social environment for reforms and the four modernizations.

The successful fulfillment of the Sixth 5-Year Plan has laid a good foundation for the implementation of the Seventh 5-Year Plan and firmed our confidence in winning even greater victories. However, we must soberly realize that many shortcomings did exist and certain slipups did happen in our work in the past 5 years. Both our thinking and our work fell short of the rapidly changing situation. In the course of reform, we underestimated possible problems because of our lack of experience. Since we began implementing the policy of opening to the outside world and invigorating the economy we again encountered such problems as overinvestment in fixed assets, excessive increases in consumption funds, and sharp rises in commodity price indicators. After we tightened macroeconomic control, the practice of demanding uniformity in everything reappeared. As we concentrated our strength on economic construction, we overlooked ideological and political work and the building of spiritual civilization, resulting in many problems, including some serious ones, connected with the cadres' workstyle and the standards of social conduct. There are still many difficulties on the road ahead. Acute shortages in the supply of energy and major raw and semifinished materials and inadequate transportation facilities are still restricting our province's economic development. With the continued reduction in land acreage planted to grain crops, it is difficult maintaining a steady growth in grain production. Industrial enterprises are confronted with new tests amid keen competition for markets. Serious shortage of competent personnel, in particular competent economic management personnel, is limiting our efforts to develop the economy and raise our economic efficiency. Moreover, economic development in various parts of the province is quite uneven. In some mountainous areas, the poor and backward state has not been radically changed, and the food and clothing problems for a few people have yet to be resolved. With regard to these difficulties and problems existing in the course of our advance, we should not exaggerate them because to do so would produce an adverse effect on our confidence to make progress; nor should we take them so lightly as to adversely affect the healthy development of our reform and construction. We must take a serious attitude in summing up experience, work conscientiously, and rely on the concerted efforts of the people in the entire province to overcome the difficulties ahead of us, to further develop our excellent situation, and to do an even better job in fulfilling the tasks of the Seventh 5-Year Plan than in the Sixth 5-Year Plan.

What should we learn from our experience in carrying out the Sixth 5-Year Plan?

/1. Insist on reform, make in-depth reform, and use reform to spur on economic and social development./

During the Sixth 5-Year Plan, we gradually developed reform work in various areas as arranged by the party Central Committee and the State Council. Economic structural reform began in rural areas. We changed the method of pooling labor to do collective work and the system of centralized distribution; instead, we widely popularized a system of contracted responsibilities based on the household with remuneration linked to output. We changed the unified and fixed purchase system for farm and sideline products, readjusted the rural production structure, and went all out to develop diversified operations and village and town enterprises without overlooking grain production. As a result, the rural commodity economy developed quickly, a large amount of surplus labor was put to use, and the broad masses of peasants embarked on the road of getting rich through industrious work. This major breakthrough in rural reform greatly encouraged us to proceed with urban reform. During the last 2 years, we thoroughly implemented the State Council's "Provisional Regulations on Further Expanding the Decisionmaking Power of State-Owned Industrial Enterprises" and formulated policies and regulations aimed at accelerating the development of urban collective industries and village and town enterprises. In this way we changed the previous management system characterized by excessive centralization and overly rigid control and gave greater authority to enterprises to make their own decisions. Afterwards, we took a giant step in reforming the price and wage system. This brought about an unprecedented vigorous climate for production, commodity circulation, and other economic work in both cities and the countryside. Most enterprises gradually increased their vitality. In particular, the rapid development of collective enterprises and household enterprises, including those established jointly by several households, was beyond our expectations. With regard to opening to the outside world, we began to change the previous seclusion or semiseclusion and switched to an open-type economy by introducing investment from abroad and establishing lateral ties at home. Our foreign trade continued to increase while our economic and technical cooperation with foreign countries and our international exchanges in the fields of science, technology, and culture became increasingly vigorous. New progress was also made in promoting economic and technical cooperation between our province and other provinces and municipalities; such cooperation started with the supply of materials and gradually developed into multilayer, multichannel, and diversified economic and technical cooperation and association, contributing to our province's accelerated economic construction. In addition, we made new attempts to reform our scientific and technological work and education systems and obtained some fresh experiences in these fields. Practice during the Sixth 5-Year Plan has made us aware that reform is a motive force for production and construction in all fields, and that our province's rather fast economic development during that period can indeed be attributed to reform. But, we must be more farsighted and realize the far-reaching importance of reform in our work of building socialism with Chinese characteristics in the next 30 or even 50 years. Since reform in the past 5 years has produced such remarkable results, persistence in continuing reform is bound to bring about a new situation of socialist modernization in our country characterized by even greater prosperity and affluence.

A review of the course we traversed during the Sixth 5-Year Plan shows that our understanding of reform has, in fact, been heightened step by step in the course of practice. At the inception of rural reform, some of our comrades lacked adequate understanding of and were skeptical about the system of contracted responsibilities based on the household with remuneration linked to output. After more than 2 years of practical work in this regard, our comrades' understanding has become relatively unanimous. While carrying out reform in urban areas, epsecially after the commencement of price and wage reforms, the problem of inadequate understanding has again appeared among some comrades. On the other hand, we are not foresighted enough to predict the new problems and contradictions that may crop up. This state of affairs is not surprising, but the important prlblem is that we are not mentally prepared enough to face the difficulties and complexities of reform. Reform is a great cause that no one else practically pursued in the past; it also involves a certain degree of risk. There is neither a ready example to follow nor mature experience to copy. All that we can do is to strive to practice, gain understanding, sum up our own experience, and explore ways to advance under the guidance of fundamental Marxist principles. In particular, under the complicated circumstances where the old and new system coexist and affect each other, some unlawful elements may take the opportunity provided by reform to carry out criminal activities, and certain unhealthy trends may grow if we do not do enough to strengthen our leadership and formulate systems and laws to cope with the new situation. How shall we solve the problems we encounter in our course of advance? Shall we insist on reform and continue to explore new ways to advance, or go back to the old road? Obviously, by retrogressing, we will not be able to find a way out. Only through intensive reform can we find solutions to these problems and create favorable conditions for replacing the old system with the new. We must see the prospects of reform and be mentally prepared to face the difficulties and complexities of reform. Certainly, reform will rejuvenate China and make our country strong and our people affluent, but it is a process that involves hard work. Reform cannot be smooth sailing, nor will every step we take toward reform really benefit everyone. We must properly handle the relationship between the interests of the whole and those of the part and between long-term and immediate interests. We must take a correct attitude toward reform, energetically support it, and unswervingly plunge into this work.

/2. Persist in proceeding from reality, bring into full play our strong points, sidestep our shortcomings, and take the road of economic development in conformity with the situation in our province./

Let us look into our province's economic structure. In industry, the major trades are the manufacture of light industrial products and textiles. Most enterprises are small and collective enterprises, and the vast majority of their products are people's daily necessities. Some high-quality products have a good market at home or abroad and enjoy a fairly good reputation. On the other hand, energy resources, raw and semifinished materials, and transportation facilities are rather inadequate. As for agriculture, the yield per unit area is rather high and diversified operations are relatively developed. However, the problem is that there are many people while farmland acreage is limited. Also, many mountain and marine resources have yet to be exploited. During the Sixth 5-Year Plan, we paid attention to exploiting the strong points of our light industry and our small and collective enterprises as well as of the diversified operations in rural areas. This had a great positive effect on enlivening our economy and developing commodity production. Take industry for example, light industry and small and collective enterprises, because of their flexible operations, can utilize two favorable conditions available in our province--the relatively abundant supply of farm produce, which is a source for raw materials, and the vast labor force. For this reason, in implementing the principle of "readjustment, restructuring, consolidation, and improvement," we have put the development of light and textile industries to the fore and carried out the guideline of "six priorities" in appropriating funds and in supplying energy as well as raw and semifinished materials to these industries. In the meantime, a series of measures have been taken to give active support to the development of neighborhood industries in urban areas as well as of village and town industries. At present, the output value of collective industries exceeds that of state-operated industries in the province. Economic development of such cities and counties as Shaoxing, Yinxian, Xiaoshan, Yuyao, and Haining has been faster than that of others because they are giving full play to the superiority of rural industries. Considering local economic conditions, Wenzhou City has made great efforts to develop household industry, partnership household enterprises, and all kinds of small commodity markets, and has initially created large markets for small commodities. While giving full play to our strong points, we have also taken into account our shortage of energy resources and raw and processed materials and the strained transport situation, and started a number of key construction projects in accordance with the state plan, such as a berth for 100,000-metric-ton ships and a harbor railroad at Beilun harbor, the urea plant of the Zhenhai petrochemical general plant, the Zhejiang polyester plant, the Taizhou power plant, and the Zhenhai power plant. These projects, after having been completed and put into operation, will be of great significance to Zhejiang's economic development.

Giving full play to strong points, making up for weaknesses, and gradually readjusting the production structure is a long and arduous task. Faced with intense market competition, if our enterprises, particularly town and village enterprises, fail to speed technological transformation, improve management, improve product quality, reduce consumption, and actively train qualified personnel, our strong points in light industry and in small and collective enterprises will weaken and become unable to meet the changing situation. We have built some energy, communications, and raw and processed materials industry projects, but the strained situation in these areas has still not fundamentally improved and it is necessary to make greater efforts. At the same time, we should also make great efforts to strengthen our building industry, commerce, transport, service trades, and tertiary industry to further rationalize the production structure and ensure steady and balanced economic development.

/3. Maintain steady growth so that better economic results will be achieved./

During the Sixth 5-Year Plan, our province's total industrial and agricultural output value increased at an average annual rate of 17.8 percent. In 1985, the increase exceeded 30 percent. The increase resulted from many positive factors. For instance, the economic structure reform aroused the initiative and creativity of enterprises and the masses, technological transformation projects undertaken several years ago gradually yielded effects, and some new projects were completed and put into operation. However, the increase was also due to some special and abnormal factors, such as stimulation by overinvestment in fixed assets and a sharp increase in imported raw and processed materials and assemblies. These abnormal factors adversely affected the macroeconomic balance. Some enterprises and localities blindly vied with each other to expand the scope of capital construction and increase consumption funds, and caused strains in communications, a shortage of energy, raw and processed materials, and funds, and a sharp rise in commodity prices. We must remember this lesson.

Economic development must be kept at a proper speed. Proper economic growth is needed to enhance our national strength and improve the people's living standards. A stagnant economy will adversely affect market supply, revenues, and the development of science and technology, education, culture, public health, and other social undertakings. However, if we blindly seek a high growth rate and expand the scope of capital construction without regard to objective conditions and the capabilities of the state and society, strains will result. In such a case, the high growth rate will not last long. Sharp increases or decreases in growth are extremely harmful to economic development. Therefore, we must clearly understand that what we need is economic growth achieved through improving management, accelerating technological transformation, tapping potentials, and improving economic results. Economic growth achieved in this manner is real and highly beneficial; it is the proper kind of growth, the kind we are after. For this reason, we should not blindly seek a high growth rate when the situation is good. Nor should we hesitate to press forward and slacken our efforts when the going is tough. In dealing with the growth rate issue, we must assume the scientific attitude of seeking truth from facts, fully consider our needs and capabilities, and seriously study objective conditions and the subjective factor of effort. The objective conditions include such essential elements as wnergy, materials, funds, and transport. The subjective factor of effort means human initiative and creativity, including efforts to improve management and quality, reduce consumption, reduce waste, and increase labor productivity. When objective conditions permit, we should display our subjective initiative to the maximum extent, bring into play the initiative and creativity of dealers and producers, and ensure a proper and steady economic growth rate.

/3. Persist in putting scientific and technological progress and education development in important strategic positions; coordinate development of scientific, technological, and educational undertakings with economic construction; and beef up the reserve force for the four modernizations./

During the Sixth 5-Year Plan, while attaching great importance to economic construction, provincial leaders at all levels became more and more aware of the importance of scientific and technological progress and intellectual resources development to economic construction and began to establish the concept that economic construction must rely on scientific and technological progress and education development. First, they broke free from the outworn concept of despising knowledge and looking down on intellectuals, seriously implemented the policy toward intellectuals, and succeeded in recruiting and employing a large number of talented people of real ability and learning, including capable persons who, although without college diplomas, are really capable in practice. Second, many economic departments and enterprises cooperated with scientific research and education units both inside and outside the province in integrating production with scientific research and education. They made joint efforts to serve economic construction by employing advisers, making technological transfers, providing periodic consultations, and adopting other ways and means. Governments at all levels, urban and rural enterprises, and various social circles all lent support to education and helped schools solve practical problems and improve teaching conditions. Comrades in the scientific, technological, and education departments also came to realize from practice that education, science, and technology must meet the needs of economic construction and social development and contribute to the four modernizations.

We must also realize, however, that our current science, technology, and education are still relatively backward and unable to meet the needs of economic construction and social development. In science and technology, our efforts are scattered, scientific research work is at a low level and being duplicated, and scientific and technological achievements cannot be translated promptly into production results. In education, we have lopsidedly chased after a high rate of students passing entrance examinations and entering schools of higher level, a large part of the education funds are spent on personnel expenditures, the schools lack funds for improvement, the educational and professional levels of some of the teachers are low, and the quality of students they have trained fails to meet the requirement of national construction. Therefore, we must have a sense of urgency in accelerating the development of science, technology, and education. We must actively promote structural reform in scientific, technological, and education departments and solve some problems in a down-to-earth way, thereby providing economic and social development under the Seventh 5-Year Plan with a still stronger reserve force.

II. The Basic Mission and Major Tasks of Economic Construction Under the Seventh 5-Year Plan

The Seventh 5-Year Plan serves as a link between the past and the future. Success in these 5 years is of great significance in consolidating and exploiting the new situation opened up during the Fifth 5-Year Plan and in laying a good foundation for economic revitalization in the 1990's and fulfillment of our strategic goals by the end of this century. In compliance with the general requirement of building socialism with Chinese characteristics and the basic principle of invigorating the domestic economy and opening to the outside workd, and in accordance with the National Seventh 5-Year Plan and Premier Zhao Ziyang's report on the Seventh 5-Year Plan, the general guiding principles for our province's Seventh 5-Year Plan are: To promote reform and development with more reform and development, to bring into full play our economic strong points, to ensure the construction of key projects, to improve the industrial structure, to strengthen the agricultural base, to accelerate scientific and technological progress and intellectual resources development, to raise economic results, to beef up the economic reserve force, to continue improving the livelihood of both urban and rural residents, and to promote socialist spiritual construction.

We have established this guiding principle mainly in consideration of the new circumstances and needs confronting us during the Seventh 5-Year Plan. These circumstances and needs are: First, the Seventh 5-Year Plan marks a period of full-scale reform of our economic structure. During this period, we must make further efforts to bring the various economic sectors into balance and put the new economic system in a dominant position. Basically, we should lay the foundation for a new socialist economic structure with Chinese characteristics. Second, the state-sponsored key construction projects to be built in our province during the Seventh 5-Year Plan period are of an unprecedented scale as far as projects in our province are concerned. To exploit the favorable conditions of our province's coastal ports, the state has decided to make a large amount of investment in our province even under the present circumstances when the scale of investment in fixed assets still has to be controlled. This means that an added responsibility has been placed on our province in developing the national economy. We should take it as one of our major tasks to have these key construction projects completed successfully. Third, the Seventh 5-Year Plan not only calls for construction work on a larger scale, but also requires that our production structure be further improved and our economic efficiency and technological competence be raised to a new level. Under these circumstances, we should step up our efforts to develop energy and other basic industries, actively explore new production undertakings, speed up technological upgrading, and improve operations and management while continuing to give full play to the strong points of our diversified rural economy and our light industry and small and collective enterprises. At the same time, we should continue attaching strategic importance to the development of science, technology, and education. Fourth, based on the experience gained during the Sixth 5-Year Plan, we should continually uphold the principle of "grasping with two hands" and strengthen ideological and political work and the building of the democratic and legal systems in order to ensure the smooth progress of reform and economic construction during the Seventh 5-Year Plan. We should not only continue to improve the people's material life but also take further steps to enrich their cultural life, consolidate and develop the political situation characterized by stability and unity and vigor and vitality, and push the work of building a socialist spiritual civilization to a new high.

Our main tasks and targets for economic and social development during the Seventh 5-Year Plan are as follows:

1. We should give priority to reform, make reform and construction suit and promote each other, and have the old economic structure by and large replaced by a new one.

2. While improving economic efficiency as a prerequisite, we should bring the gross value of our industrial and agricultural production to 100 billion yuan by the year 1990, representing an average annual growth rate of 8 percent. The gross domestic product should be raised to 58 billion yuan, averaging 1,365 yuan per capita. Both of these categories will be making a more than twofold increase over the 1980 figures. Financial revenue should reach 8.5 billion yuan, and expenditure 5.2 billion yuan, an average increase of 7 percent per annum.

3. While energetically stepping up the technological transformation of our present enterprises, we should concentrate our efforts on key construction projects and see to it that development of agriculture and the processing industry is coordinated fairly well with the development of energy resources, transportation, the raw and semifinished materials industry, and other basic industries as well as with infrastructural construction. Moreover, there should be a conspicuous increase in our economic strength.

4. We should further boost our capabilities of opening to the outside world and earning foreign exchange through exports. By 1990, our foreign exchange earnings through exports should reach $1.4 billion. In addition,

we should see to it that opening of the coastal areas to the outside world helps develop the interior, and that their lateral economic ties are strengthened to a great extent.

5. We should continue to energetically develop efforts in science, technology, and education. Emphasis should be placed on solving 35 key problems in science and technology and promoting the application of 50 new technologies. Basically, in the part of our province where inhabitants account for three quarters of our population, the 9-year compulsory education system should be put into effect. In addition, 140,000 people should be given college education.

6. Further efforts should be made to improve the people's living standards. The actual consumption level of both urban and rural people should be raised by about 25 percent. The natural population growth rate should be controlled at a level below 10 per 1,000.

7. We should further improve the socialist democratic and legal systems and effect a fundamental turn for the better in standards of social conduct and social order.

In view of the demands in our province's Seventh 5-Year Plan, emphasis should be put on the following main tasks in economic construction:

/1. Continue to strengthen agriculture as the foundation of the economy and further promote the all-round development of the rural economy./

During the Seventh 5-Year Plan, economic construction will be carried out on a large scale, all undertakings will be further developed, and our population will gradually increase. All these necessitate a new stage of agricultural development. At the moment, our agriculture still lacks a sound foundation. There are many factors restricting the further development of our agriculture. Examples are: the bad condition of a number of irrigation works, the reduced acreage of arable land, the loss of land fertility, the lack of new breakthroughs in agricultural science and technology, and the dwindling enthusiasm on the part of some peasants for farm work, especially for growing grain crops. Governments at all levels should make a serious effort to strengthen their leadership over agriculture, while people of all walks of life should take it as their major task to support agriculture. They should really regard agriculture as the foundation of our economy and strengthen it in all conceivable ways. Besides making continued efforts to deepen rural reform and implementing the necessary policies to arouse the peasants' initiative, we should orient our efforts in agricultural development from now on toward relying more on science and technology, increasing the funds and materials put into agriculture, and providing better conditions for production. In addition, we should continue to readjust the rural production structure step by step and take the path of comprehensive development, intensive farming and processing, multiple increase in value [duo ci zeng zhi 1122 2945 1073 0237], preservation of the ecological balance, and promotion of self-sustained growth.

Making continued efforts to grasp grain production so as to ensure a steady increase in our grain output remains a task of prime importance in agricultural production for the Seventh 5-Year Plan period. According to the requirements set in the Seventh 5-Year Plan, we should become basically self-sufficient in grain supply and should have suitable varieties of grain. The average annual output should be 4.4 percent higher than under the Sixth 5-Year Plan. By 1990, our grain production should reach 17.5 to 18.5 million metric tons, exceeding the 1985 output by 1.3 to 2.3 million metric tons. When this target is met, the per-capita average is still not very high. Therefore, we should keep the acreage of grain fields stable, highly treasure our arable land, and strictly prohibit the misuse of such land for other purposes. We should continue to keep to the policy of using industry to subsidize agriculture, using sideline production to foster agriculture, and using cash crop cultivation to support grain cultivation. At the same time, we should make every effort to raise the output per unit area of land and continue to adopt measures aimed at transforming low-yield land, opening new commercial grain production centers, and developing high-yield fodder crops.

By stressing grain production, we are by no means going back to the beaten track of only grasping grain. What we need to do is to readjust our production structure in an active yet reliable way and fully implement the principle of "never relaxing grain production and actively developing diversified operations." In readjusting our production structure, we should not change the acreage of our grain fields. The main task in this regard is to explore new ways to promote production other than by changing our arable land. In accordance with the resources available and the economic conditions in various localities, we should make energetic efforts to develop such undertakings as farming using multitiered planting structures in greenhouses, engaging in agriculture for earning foreign exchange, and making farms and plantations double as tourist attractions. At the same time, we should develop secondary and tertiary industries. In developing agriculture, we should take all parts of the province into consideration. This means we should explore and exploit to the full all barren mountains, water areas, beaches, and islands for developing those crop-cultivation, animal-breeding, or aquaculture projects that can utilize local resources to turn out products required by the domestic or international market. It is necessary to continue to readjust the structure of forestry production and speed up its development by combining our weaknesses and strong points and developing forestry in a comprehensive way. Efforts should be made to promote fishery; and, while stabilizing offshore fishing to preserve our resources, we should strive to develop oceangoing fishing as well as seawater and freshwater aquiculture. Intensive processing and comprehensive utilization of farm and subsidiary products for the purpose of multiplying value is an exploitative undertaking with great potential. All agricultural, urban, commercial, and scientific and technological departments should pay close attention to development and research in this undertaking, step up efforts to popularize scientific and technological achievements, and mobilize and organize more scientific and technical personnel to work in the countryside for the all-round development of the rural economy. Each locality should select a few key products, set up production bases for them, and create a chain services comprising technical guidance, processing and packing, and storage and marketing. At present, supply and marketing cooperatives in some localities have set up service industries, which have brought about closer relations between agriculture and commerce through utilizing and processing farm and subsidiary products and exploiting natural resources, thereby invigorating the cooperatives themselves. It is necessary to actively popularize such experience of supply and marketing cooperatives and strengthen the leadership over them so that they can better serve the development of the commodity economy in rural areas.

Material investment should be increased in both grain production and diversified undertakings. The province, cities, and counties should spend as much funds as possible on agriculture, appropriately increase loans for peasants, and, more importantly, encourage peasants to rely on their own accumulation in expanding agricultural investment, carrying out farmland capital construction, and gradually improving production conditions.

Developing village and town enterprises is the only way to invigorate the rural economy. During the Seventh 5-Year Plan, it is necessary to consolidate and upgrade village and town enterprises in line with the principle of "actively supporting, rationally planning, correctly guiding, and intensifying supervision" with regard to enterprises. By 1990, the total annual output value of village and town enterprises should reach 40 billion yuan, or 40 percent of Zhejiang's gross industrial and agricultural output value, a task that we should not take lightly. To make village and town enterprises more competitive, we should bring into full play their advantages in flexible management and strong adaptability. It is necessary to transform the competitive relationship between city industries and village and town enterprises into one characterized by mutual dependence, assistance, and cooperation to achieve mutual development. City industrial enterprises, scientific research institutions, and schools of higher learning should help village and town enterprises explore production resources, improve product quality, and raise economic efficiency through transfering technology and products, training skilled personnel, providing information, and raising funds. Special efforts should be made to help underdeveloped areas promote village and town enterprises so that local natural resources can be utilized as quickly as possible. In improving production conditions and carrying out the production on an extensive scale, it is necessary to correctly handle the relationship between accumulation and consumption of village and town enterprises and eliminate the practice of dividing up and exhausting accumulated funds and relying on loans to develop production.

Despite rich natural resources, a large number of mountainous areas and a few islands are relatively backward economically and culturally, and a few of them are still quite impoverished. It is necessary to select cadres with strong dedication to transform the backwardness and to send them there to replenish and strengthen the leading bodies of these localities. To build their capabilities for self-development, it is necessary to adopt realistic policies and measures to introduce advanced management methods, skilled personnel, and technology as well as provide loans to these localities. We should help them exploit their resources by carrying out a number of production projects that need little investment and a short construction period, but are conveniently located and can yield quick economic results, and by developing their transportation, cultural, and educational undertakings. It is necessary to encourage and organize cooperation in various forms between economically advanced and backward areas based on the principle of equality and mutual benefit.

/2. Speeding up Technical Transformation, Improving Business Management, and Raising the Quality of Existing Enterprises./

We will undertake a number of key construction projects in the Seventh 5-Year Plan. However, we should still rely mainly on the existing enterprises if we want to achieve an acceptable economic growth rate and fairly good economic results. Having carried out consolidation and technical transformation in the Sixth 5-Year Plan, the existing industrial enterprises in our province have raised their technical and managerial levels as well as economic results. But on the whole, their quality is still not high, and poor product quality and low economic results are still the fatal weaknesses of most enterprises. In some enterprises the equipment is outdated and it is impossible to upgrade their products to meet the changing demands of the market; while in others, the methods of operation and management are backward, waste is serious, and economic results are poor. Some of these enterprises are incapable of adapting to external changes that might occur, and are incapable of meeting the changing demands. Therefore, all enterprises should give priority to quality and economic results and strive to meet the needs of the market and society. They should encourage workers and staff to act as masters of their own affairs so that each and every worker will be concerned about the enterprise's reputation as well as society's interests. Emphasis should be placed on improving product quality and lowering material and energy consumption while accelerating technical transformation, and emphasis should also be placed on improving business management of enterprises.

In the Seventh 5-Year Plan, 6.5 billion yuan will be used to carry out technical transformation in state-owned enterprises, 45 percent more than the Sixth 5-Year Plan. This is absolutely necessary. The purpose of technical transformation is to improve the quality and performance of our products, provide more designs and varieties, lower material consumption, conserve energy, and produce more readily marketable goods. The emphasis of technical transformation is on the following areas: Increasing the ability of the silk and textile industries to sort out the products after they have gone through the dyeing process; raising the technical levels of the machine-building and electronics industries and enhancing their ability to manufacture auxiliary equipment; increasing the ability of the chemical industry to engage in intensive processing and make comprehensive use of resources; developing the primary raw materials as well as new techniques and methods of packing for the light and food-processing industries; and developing new materials and technologies for the building materials industry. In light of Zhejiang's practical conditions, we should also vigorously promote knowledge- and labor-intensive industries and products that consume less energy, require less shipping, occupy fewer land areas, and create less pollution. To encourage enterprises to carry out technical transformation, preferential treatment should be offered in taxation, credit and loans, and goods and materials. Technology should be imported in a well-planned and selective manner by taking the purpose and areas of emphasis of technical transformation into consideration. Primarily software and crucial equipment will be imported. These should be thoroughly absorbed and utilized. Importation of ordinary processing equipment should be strictly controlled.

Technical progress and the improvement of managerial skills go hand-in-hand. Without advanced management, the best equipment and technology cannot be fully utilized. In the Seventh 5-Year Plan great efforts should be made to improve and modernize business management in enterprises. Having emphasized enterprise consolidation in the past few years, we should ensure the soundness of leading bodies andthe system of production management; perfect the responsibility systems; continue to properly handle standards, metrology, fixed quotas, statistics, and testing work; organize production according to advanced standards at home and abroad; gradually adopt the methods of value engineering, goal and cost management, and comprehensive quality control; and actively train workers, give promotions, create advanced models, and raise the overall quality of enterprises. To encourage enterprises to improve product quality and pay attention to economic results, it is necessary to set the targets for quality, technology, and economic results, in addition to the target for output value. Appropriate policies and measures should be taken accordingly.

Most enterprises not included in the state technical transformation program, village and town enterprises in particular, should make use of their own accumulation and follow Comrade Lu Guanqiu's example in improving enterprise management while spending money to upgrade equipment, train workers, and adopt new techniques to make their products among the best. Governments and departments at all levels should show concern for and support technical transformation in smaller enterprises, and should help solve their practical problems so these enterprises will continue to boost their technical levels and economic results.

All enterprises should give full attention to labor protection and production safety, educate their workers to strictly observe operating procedures, and strive to avoid serious accidents and reduce losses to the people's lives and property.

/3. Build Key Construction Projects Well To Promote Zhejiang's Economic Development./

During the Seventh 5-Year Plan, capital construction investment arranged by the state and province equals about 85 percent of the total investment in all the capital construction projects completed in the past 36 years since the founding of the People's Republic. During the Seventh 5-Year Plan, the scope of capital construction is large with many key projects requiring advanced technology. Many projects are related and make up comprehensive systems. The plan contains 90 key projects, of which 11 deal with energy, 22 are transport projects, and 6 are postal and telecommunications projects. There are also a number of projects for heavy industry, chemical industry, raw materials of light and textile industries, consumer goods industry, agriculture, scientific and technological education, and social development. The investments in projects for energy, transport, telecommunications, and raw and processed materials industry account for 60 percent of the total investment in state capital construction projects. These many key projects will help improve Zhejiang's economic structure and enhance our reserves for further economic development. However, they will also create strains in manpower and financial and material resources. In this sense, our province's Seventh 5-Year Plan is inspiring and, at the same time, a source of tension. Such tension always exists before a structural contradiction is alleviated. How to bear with and tide over such temporary tension and strive to overcome contradictions and difficulties caused by the tension is a major subject worth our painstaking study. We must strengthen leadership and carefully organize and pool manpower, funds, and materials to ensure smooth progress in key capital construction projects. All key projects should be built under a system of division of labor with individual responsibility according to their scope and affiliation. Building time should be rationally kept to a minimum in order to improve the investment results. We should select and put the best personnel to work at the forefront of construction, just as we did to supportthe construction of China's 156 key projects in the 1950's. All localities and departments should deem it their glorious duty to support the construction of key projects. The localities where key projects are built should make more contributions, particularly in funds, materials, and logistical support.

The key projects are determined by the state according to the strategic needs of economic development and according to our economic and natural conditions. They are conducive to tapping the potential of the coastal ports of our province. Now, everyone hopes the state will build some key projects in his locality. Such a hope is justified and understandable. However, our country's financial and material capabilities are limited. If we build everything we need at the same time, our financial and material resources will be dispersed, and it will hurt both the provincial and local interests this way. We should know that although the key projects are built in certain places, their benefits will be felt throughout the whole province, and they are in the interests of all the people in the province. Mutual reliance exists between key regions and ordinary regions, between coastal areas and inland areas, and between old industrial districts and new industrial districts. Key regions should on their own accord develop associations with other regions and move some suitable factories to inland regions. The regions not covered by key projects are not in a state of inertia either. They can take the opportunity to develop production of building materials, equipment for key projects, hardware, and nonstaple food according to local conditions, and can provide construction workers to actively serve in the construction of key projects. In this way they will make contributions in support of the construction of key projects, and at the same time promote local economic development.

The shortage of funds and materials is a conspicuous contradiction of the Seventh 5-Year Plan. In order to solve the contradiction, we must properly use the state investment and rely on local efforts to increase financial and material resources and conserve consumption. We should learn how to accumulate and spend funds. On the one hand, we should raise funds and materials in various ways--such as through encouraging savings deposits, through pooling resources to run power plants and raw and processed materials industry, and through acquiring investment from outside the province and from foreign sources. On the other hand, we should continue to control the scope of local investment in capital construction, seriously examine and readjust the projects under construction, rationally use funds and materials, ensure the completion of key projects while taking good care of other projects, do what we are capable of, and stress practical results.

/4. Do a still better job in developing the work in science, technology, and education to serve the needs of economic construction./

During the Seventh 5-Year Plan, we should persistently attach strategic importance to making advances in science and technology and developing intellectual resources and see to it that new progress and improvement are made in our work in science, technology, and education, not only in quantity but also in quality, so as to meet the needs of economic construction.

There are many tasks to be done in the field of science and technology. During the Seventh 5-Year Plan, we should, in particular, give attention to broadening the application of fruitful results we have achieved in scientific and technological research and making joint efforts to solve key problems in science and technology. From among the fruitful results we have achieved in scientific and technological research, we should select those that can produce quick and great benefits and apply them to production as soon as possible by processing them through the science and technology market or integrating scientific research and production. This should include the application of new technologies in transforming traditional industries, and is intended to have the achievements of science and technology quickly translated into productive forces. Serious efforts should be made to carry out the "Spark Plan" projects sponsored by the state and by our province. Meanwhile, scientific and technological research personnel from all quarters should be organized to work together on key projects concerning our province's economic construction and social development. In natural science, emphasis should be put on making joint efforts to solve the 35 key problems that have a significant bearing on our province's development, such as the development of the Ningbo deepwater port, new techniques for breeding and cultivating staple crops, new silk products, and application of bioengineering to agriculture, industry, and medicine. Apart from this, continued efforts should be made to strengthen basic research. Insofar as our capabilities permit, we should also embark on new- and high-technology research and try to achieve some results in this respect.

Social science research should be geared to the needs of reform and the four modernizations. By actively applying the basic principles of Marxism, we should boldly probe and study in depth the major theoretical and practical questions encountered in socialist modernization, especially important issues concerning our economic structural reform and strategies for our economic, scientific, technological, and social development, so as to serve the needs of leaderships at all levels and of all departments in making policy decisions.

Advances in science and technology and development of intellectual resources depend on education as the foundation. Our province has decided to earmark 4 billion yuan for education during the Seventh 5-Year Plan. This is 90 percent more than the amount for the Sixth 5-Year Plan. Governments at all levels and their education departments should use this money properly so as to achieve the intended beneficial results. It is necessary, if at all possible, to appropriate some funds to support the education work in mountainous areas, on off-shore islands, and in other places faced with economic difficulties, give them assistance in creating better conditions for running schools, and help them train teachers or send some teachers to work in their place. At the same time, members of democratic parties and people of all communities should be encouraged to establish various kinds of schools as a way to contribute more to the development of education. We should seriously implement the "Law of Compulsory Education of the People's Republic of China," attach great importance to the education of teachers, enlarge their contingent, raise their quality, carry forward the social mood of respecting teachers and paying attention to education, and create necessary conditions for popularizing the 9-year compulsory education system. Importance should also be attached to kindergarten education. Active efforts should be made to develop secondary vocational and technical education. In this regard, we should put emphasis on spending more efforts to improve quality, overcome the idea of despising vocational and technical education, and further implement the policy of training people before hiring them. In higher education, we should concentrate our efforts on consolidating, improving, and building support facilities for existing colleges and universities, and in general not build new schools of higher learning. It is necessary to systematically readjust the level and mix of specialities of existing colleges and universities, and lay special emphasis on developing specialities of practical use, such as finance and economics, management, medicine and pharmacy, political and legal sciences, and tourism, which are in great demand. Efforts should be made to actively promote adult education in various forms, mainly sparetime adult education. Satellite TV education should be considerably expanded. In adult education, we should focus attention on strengthening political and technical training of workers and staffs, and refrain from placing undue emphasis on getting a diploma. In order to gear ourselves to meeting the needs of modernization, schools of all types and at all levels should improve their teaching programs and methods, give top priority to raising teaching quality and training qualified personnel, and overcome the gap between the training of personnel and the needs of the modernization drive as a result of overemphasizing the importance of having a larger proportion of students going to higher-level schools.

/5. Do a better job in opening to the outside world, and build up the capabilities to earn more foreign exchange through exports./

During the Seventh 5-Year Plan, the coastal open cities and areas should do a better job in opening to the outside world in line with the arrangements and demands made by the State Council. In view of its large-scale development, Ningbo City should earnestly carry out the planned construction projects, strive to build more technology-intensive projects to produce mainly export commodities or commodities that may substitute for imports, and combine the development of the new city area with the transformation of the old one. Wenzhou City should give top priority to water and air transport, step up infrastructural construction, and improve the investment environment. Hangzhou City should make maximum use of its tourism by building more tourist facilities and developing some high-grade electrical and mechanical engineering products and consumer goods for daily use, thereby bringing into play its role as a "window" for economic and technical exchanges with foreign countries. Jiaxing and Huzhou cities should intensify technological transformation of existing enterprises and construction of export commodity bases in accordance with the demand to promote export trade. All open cities and areas should, for the purpose of increasing exports and earning more foreign exchange, expand economic, trade, and technical exchanges with foreign countries, and make positive use of foreign capital to import technology. They should also earnestly improve import work, use their foreign exchange earnings rationally, concentrate on using imported capital, technology, and equipment to upgrade existing enterprises technologically and on building up the capability to earn more foreign exchange through exports, and do everything possible to increase the economic yield of foreign capital.

The key to further opening to the outside world is to increase exports and earn more foreign exchange. In view of Zhejiang's large variety of export commodities and great potential, we should strive to greatly increase our foreign trade during the Seventh 5-Year Plan. According to the plan, Zhejiang should increase its foreign exchange earnings at an average of 11.7 percent annually in comparable terms. To achieve this target, we should focus our attention on the work in the following three fields: First, it is necessary to do our utmost to earn more foreign exchange by exporting quality goods and boosting their ability to compete on the international market. We should strive to improve the export commodities mix and, while continuing to promote exports of traditional farm and sideline products, develop new export products on the basis of international market demands. We should also actively increase the proportion of manufactured goods among export commodities, especially the proportion of electrical and mechanical engineering equipment, electronic devices, and nonmetallic products. Second, it is necessary to combine foreign trade with increased production in industry and agriculture and introduction of new technology by gradually setting up export commodity bases and special plants and workshops of various kinds and specific characteristics to increase the production of export commodities. It is necessary to implement policies and provide incentives to encourage the production of export commodities and actually benefit workers and staffs of enterprises that earn more foreign exchange by increasing exports. Third, it is necessary to improve the management of foreign trade and actively explore the international market. We should devote more time and energy on studying and surveying the international market, familiarize ourselves with the changing demands of the international market, do good publicity work for our export commodities, and expand the export commodity marketing network. We should raise the professional competence of our foreign trade personnel, improve management and operations, keep our promises, and provide good services. Moreover, it is necessary to take advantage of our large number of skilled workers to contract for more construction and installation projects and increase our labor service exports to foreign countries.

Developing tourism is an important way to promote economic, technical, and cultural exchanges with foreign countries, as well as an important source of foreign exchange. We should strive to receive more than 500,000 foreign tourists by the year 1990, 83 percent more than in 1985, and to earn U.S.$50 million from tourism, doubling the 1985 figure. With Hangzhou as the center, we should strive to link up the tourist routes in eastern, western, and southern Zhejiang. Tourism should be promoted as a comprehensive and important industry. We should conscientiously formulate plans to develop tourist attractions, protect scenic spots and cultural relics, build tourist facilities, produce tourist souvenirs, and improve quality of service. By promoting tourism, we should be able to boost the development of the catering services, transportation, arts and crafts, cultural performances, and entertainment.

/6. Continue To Improve the People's Livelihood on the Basis of Increased Production./

To constantly improve the people's material and cultural lives is a fundamental goal of socialist production, as well as an important task for the people's governments at all levels. The Seventh 5-Year Plan requires that the annual per capita net income of peasants in Zhejiang increase by about 7 percent, and the per capita wage of workers by about 5 percent. Improvement in the people's living standards should be based on an increase in production. It should conform to the realities of our nation and fall within our capabilities. Unilateral stress on production and construction, to the neglect of an improvement in the people's livelihood, will not work. However, if the increase in consumption is faster than that in production and labor productivity, resulting in excessive consumption [chao qian xiao fei 6389 0467 3194 6316], this would not work either. It is necessary to correctly guide the people in urban and rural areas in satisfying their needs and, in consumption in their daily lives, continue to develop the fine tradition of "waging a hard struggle and building the nation through diligence and frugality." In matters related to food, clothing, utilities, and housing, we should take China's conditions into consideration. We should refrain from publicizing the impractical view of high-level consumption. Consumption funds should be distributed in accordance with the principle of "to each according to his work" in order to overcome egalitarianism. Efforts should be made to avoid wide discrepancies among enterprises, and members of society.

It is necessary to establish and perfect the social security system. The comprehensive plan for old-age pensions should first be tried out in collective-run enterprises in urban and rural areas. In cities where conditions permit, this plan can also be tried out in state-run enterprises. We should continue to give special care to disabled servicemen, as well as family members of revolutionary martyrs and servicemen, do relief work, and promote other social welfare programs.

It is necessary to strengthen city construction, systematically improve traffic and housing conditions, and speed up construction of cultural, public health, and sports facilities, as well as commercial establishments, to constantly improve the people's livelihood.

Practicing planned parenthood, protecting land resources, and improving ecological environment is a basic national policy which should be implemented for a long time to come. In the Seventh 5-Year Plan, Zhejiang will reach the peak of marriage and childbirth. To fulfill the population control plan is an arduous task, which should never be relaxed. We should continue to encourage late marriages, popularize eugenics and improved child-rearing methods, urge married couples to have only one child and strictly forbid unplanned and multiple births. Land management should be strengthened in accordance with the law. Land for nonagricultural use should be earnestly investigated and analyzed. Resolute efforts should be made to stop unscrupulous occupation and misuse of arable land, as well as other illegal practices. Protection of forest, mineral, and water resources should be improved. Environmental protection should be expanded, old pollutants eliminated, and new ones strictly controlled, so that economic and social development develop hand in hand with population growth, land resources, and ecological balance.

III. Continue To Conduct Intensive and Systematic Economic Restructuring

To realize our province's grand goal for the Seventh 5-Year Plan period, the key task is to continue and intensify the various reforms--especially to smoothly resolve new problems arising during the period when the old economic system is being replaced by the new one.

The aim of the economic restructuring during the Seventh 5-Year Plan period is to step-by-step effect the transition from the old system to the new one and lay a good foundation for establishing a socialist economic system that meets the development needs of a planned commodity economy, has

Chinese characteristics, and is full of vigor and vitality. There are three major tasks involved in this economic restructuring. The first task is to make further efforts to increase the vitality of enterprises, in particular the state-run large and medium-sized ones, and enable them to become comparatively independent economic entities and socialist commodity producers and sellers, doing their business independently and being responsible for their own losses or profits. The second task is to further develop the socialist commodity markets and gradually establish the market system. The third task is to gradually change the state's largely direct control over enterprises into largely indirect control and establish a new socialist macroeconomic management system. These three tasks are mutually related and constitute an organic whole. The pivotal task in urban reform is to invigorate enterprises. Only when enterprises are vigorous is the entire society vigorous. The aim of reforming the market system is to provide enterprises with an external economic environment which both stimulates and motivates. On the other hand, the aim of the state's macroeconomic management reform is to ensure that enterprises' economic activities meet the requirements for development of the macroeconomy even more fully. The new economic system can assume the dominant position only when the reform in these three aspects has been meticulously accomplished.

In accordance with the principle of "consolidation, assimilation, replenishment, and improvement" issued by the party Central Committee and the State Council regarding the reform this year, the major task in 1986 is to mainly consolidate and assimilate the achievements already made, retain what is advantageous, and discard what is disadvantageous, and, through replenishment and improvement, gradually make all reform measures complement each other in order to create the conditions for larger-scale reforms in the next 2 years.

The major task in this year's economic restructuring is to make further efforts to increase the vitality of enterprises--particularly the state-run large and medium-sized ones. All enterprises must understand that as reform is being intensified, their own responsibilities will become heavier. They must properly exercise the self-decision power, perfect the system of responsibility for plant directors (managers), constantly improve their management, firmly establish the economic responsibility system, and make still greater contributions to the state and people by improving enterprises' quality and satisfying the demands of the market and the society. Governments and departments concerned at all levels must continue to implement the related policies and regulations formulated by the State Council and provincial government, further simplify their administration, delegate power to enterprises, and create good external conditions for invigorating enterprises. Screening must be continued for all the "four-no" companies--"centers" which have no capital of their own, no regular employees, no fixed business site, and no regular, categorized business. All unnecessary and obstructive intermediate links must be abolished. In accordance with state regulations, regulation taxes should be reduced or exempted for some enterprises and the depreciation rate of equipment should be increased in order to enhance enterprises' ability to transform themselves and develop on their own.

Another important task in this year's economic restructuring is to greatly develop lateral economic associations. Such associations not only yield results and generate productive power, but are also of tremendous significance to urban and rural reforms. They will break through departmental and regional obstructions and gradually create trans-departmental and trans-regional associations, which are an objective necessity in developing of the socialist commodity economy. Lateral associations must support enterprises' independent decision-making power and adhere to the principle of voluntary participation and mutual benefit. Departments in charge and corporations must enthusiastically support their subordinate enterprises to develop lateral associations and must not infringe upon their decision-making power. Associations may be multifarious in form. Associations should be encouraged between raw and semifinished materials-producing centers and processing enterprises, between production enterprises and research, educational units, between civilian and military enterprises, between industrial, agricultural, commercial, and trade enterprises, and between enterprises of different ownership, such as state-run and collective enterprises. At present, it is necessary to energetically encourage institutions and enterprises to join efforts to develop energy sources, transportation, and production of raw and semifinished materials, export products, and daily-use consumer goods currently in short supply. Governments and departments at all levels must firmly implement the State Council's "Regulations on Some Problems in Further Promoting Lateral Economic Association," encourage such associations in policies on funds, taxes, supply of raw and semifinished materials, and commodity marketing, and protect such associations by law. No department or region should place obstacles to association between enterprises because of its own interests. Enthusiastic support should be given to new enterprises and groups of enterprises emerging from associations, and assistance should be rendered to experimental associations in order to accumulate experiences.

In accordance with the State Council's plan, there will be no drastic commodity price readjustment this year. To maintain a general stability in commodity prices, only minor readjustments will be made in certain prices which are conspicuously irrational. We must intensify market price control; all localities and units must not exceed the bounds of authority and raise prices without permission. State-operated businesses must actively take part in regulating and stabilizing market prices. Business administrative and price departments must exercise more efficient supervision over commodity prices.

In regard to rural reform, we will continue to improve the household-based contract system that links payments to output, and we should continue to promote the contract system so that needed services will be available before, during, and after production. The principal function of the rural cooperative economic organizations is to provide needed services. Through providing information and services in the fields of supply and marketing, production, scientific and technical know how, and so forth, all government organs and relevant departments should promote agricultural, industrial, commercial and other undertakings. They should support all types of economic and specialized associations and other cooperatives in the rural areas in developing commodity production. The contract system is a good way to integrate commodity production in the rural areas with state plans and market needs, and we should consider popularizing and improving the contract system and stabilizing production-marketing relations an important matter in organizing commodity production in the rural areas. To ensure the smooth progress of rural reform and various other projects, we must attach great importance to establishing grassroots organizations in the rural areas.

Reform in the circulation sphere must continue. We must continue to implement the policy of promoting state, collective, and individual operations, at the same time giving full scope to the leading role played by state-sponsored commercial operations. We should actively experiment with new commercial operations--interregional and interdepartmental operations that integrate industrial, commercial, and agricultural sectors in one way or another--in order to promote production-marketing integration and purchasing-marketing integration among industrial, commercial, and material supply enterprises, and to promote direct, multichannel circulation. We should continue to do a good job in reforming supply and marketing cooperatives and credit unions in order to further stimulate commodity circulation.

Reform of scientific and technological management and the educational system must keep pace with economic reform. In accordance with the needs of economic and social development during the next 5 years, research and educational establishments must correct the situation where research and education are incompatible with economic development. By means of technological transfer, training of proficient personnel, and cooperation in developing new products and new technologies, the research and educational establishments should promote lateral ties with producers. This would allow them to disseminate their advanced technical know-how more effectively, know where to concentrate research efforts and what kind of personnel are needed, and improve their curricula and teaching methods.

The experiences of reform gained in implementing the Sixth 5-Year Plan show that, in addition to properly handling the relationship between reform and construction, we must also properly handle the relationship between intensifying macroeconomic control and stimulating microeconomic activities, and the relationship between destruction and construction in order to ensure smooth progress in economic reform.

Intensifying macroeconomic control and stimulating microeconomic activities are important, indispensable aspects of economic reform that must agree with the requirements of establishing a planned socialist commodity economy. In regard to commodity economy, enterprises must become relatively independent economic entities or socialist commodity producers and traders who are responsible for their own profits or losses, and who must respect the law of value, so that the vitality of microeconomic activities can be maintained. And in regard to the planned commodity economy, microeconomic activities must be guided by the state plan so that recklessness caused by market regulation can be avoided. Without macroeconomic control, microeconomic activities cannot really be stimulated; even if they have been stimulated, they cannot last. On the other hand, our macroeconomic control would again be too tight and too rigid if it fails to stimulate microeconomic activities. We must flexibly integrate the two. On the microeconomic side, we must promote lateral economic ties with the power delegated by the State Council and government organs at all levels, actively take part in competition, and continue to promote reform within enterprises, in order to arouse their initiative as much as possible. At the same time, we must voluntarily obey macroeconomic control, paying attention to combining immediate, local interests with long-range, cverall interests. On the macroeconomic side, we must, on the basis of stimulating microeconomic activities, gradually institute an economic administrative system which emphasizes indirect control. Today we must pay special attention to improving macroeconomic control and provide guidance according to the situation in different regions, industrial sectors, or enterprises. There should be no arbitrary uniformity. All government organs, especially those in charge of economic affairs, must shift the focus of their work from setting targets, approving projects, allocating funds and distributing supplies to making overall plans, upholding policies, coordinating operations, providing services, and exercising economic regulatory means and efficient supervision.

The change of the economic system and structure is a process of eliminating the rigid old structure and setting up a new one which is full of vitality and vigor. In order to guarantee an orderly progress of the reform, we must organically combine construction with destruction, pay more attention to construction and ensure that all measures for reform are mutually reinforcing. During the Seventh 5-Year Plan period, we must lose no time in learning how to administer economic management with indirect control as the principal measure, continuously improve economic regulatory measures, and strengthen economic laws and regulations and economic judicial work. We must use pricing, taxation, credit, interest rates, industrial and commercial administration, auditing, econometrics, and other economic and legal means, in addition to the necessary administrative measures, to control and regulate the economy. Following the changes in administrative functions, the various government organs must gradually carry out reforms and strengthen their economic management and supervision departments. They must adequately simplify and merge their professional departments, and separate governmental functions from business management. Government functionaries at various levels must fully realize the need to facilitate this kind of change. They must work hard to explore ways to carry out the reform, actively offer suggestions, adopt new measures, and continuously improve their work methods and style. In adopting new measures, we must earnestly carry out investigation and study, repeatedly seek proofs, take safe and reliable steps and strive to do a good job in coordinating with each other.

IV. Further Strengthen Socialist Spiritual Civilization

During the Seventh 5-Year Plan period, we must not only take new and firm steps to reform the economic structure and develop the material civilization. We must also exert even greater efforts to develop socialist spiritual civilization, help people raise their cultural qualities and moral standards, and bring about a fundamental change for the better in the social climate.

Our experience in implementing the Sixth 5-Year Plan indicates that in the course of carrying out reform, opening the country to the outside world, and invigorating the domestic economy, it is even more important to strengthen socialist spiritual civilization through our ideological and political work. In order to develop socialist commodity economy, we must respect and make full use of the law of value and attach importance to economic means and economic results. If we ignore this and slacken our efforts in doing ideological and political work, the thought of putting money above all else will prevail in our minds and undermine people's lofty spirit. The reform would inevitably have a tremendous impact on long-established models, traditional concepts, and the force of habits. It would also affect and change the original patterns of economic relations. Reform is also a gradual process. If we do not strengthen our ideological and political work, the measures for reform, no matter how good they are, will also cause misunderstanding and discontent among the people. Some people may also make use of the vacuums which exist while the new system is replacing the old system to make unjustifiable gains for themselves or for their small groups. They may engage in illegal activities such as speculation, profiteering, embezzlement, theft, bribery, swindling, or smuggling. When the country is open to the outside world, "fresh air" will come in. "Flies and mosquitoes" will also come in. If we do not stress the importance of ideological and political work, the decadent ideas of capitalism will corrupt us as a society and pollute our minds. In short, if we do not have the strength of our strong ideological and political work, we will deviate from the socialist orientation in carrying out reform and opening the country to the outside world and fail to achieve our expected goal.

Following the development of our economy and the basic solution of the problem of providing people with adequate food and clothing, the masses, particularly younger people, have even higher demands in material life. At the same time, they have even more pressing needs in spiritual life as compared with the past. They want to study more and they demand rich and colorful activities for culture, sports and recreation. They also want to travel and tour various places. If we ignore this kind of increasing popular demands and refuse to try our best to provide them with the necessary conditions, people may engage in gambling, carry out feudal and superstitious activities, or do something vulgar and disrupt the social order.

We must also realize that to develop spiritual civilization is an arduous and complicated engineering project. It is impossible to complete such a project in a day or two. A moment's ignorance may lead to a gross error which will harm people for a whole generation. When erroneous ideas and unhealthy tendencies are being formed, it is often difficult to detect them. It will be very hard to correct them once they take root. Therefore, we must regard the simultaneous development of the "two civilizations" as a strategic principle which we must uphold over a protracted period. In carrying out the central task of promoting economic construction, we must not for a moment neglect or slacken our efforts to develop spiritual civilization. Nor should we develop material civilization first and promote spiritual civilization afterwards.

An important task of ideological and political work is to conduct in-depth education on the situation and policies among the cadres and ordinary people in light of their thinking and central task over various periods. Currently education should be focused on the study and publicity of the documents of the Fourth Session of the Sixth NPC so as to mobilize the vast numbers of cadres and people to strive for an allround fulfillment of the Seventh 5-Year Plan and the gigantic goal set by the 12th CPC National Congress before the end of this century. We should help the cadres and people review the magnificent achievements scored during the Sixth 5-Year Plan, have a clear grasp of the mainstream of the current situation, enhance their confidence in reform, and raise their consciousness in implementing the party's line, principles, and policies. We should also help them thoroughly understand the basic tasks and guiding principles of the Seventh 5-Year Plan, and thus have a clear picture of the specific tasks and future prospects of each trade and profession, locality, and unit, thereby making the Seventh 5-Year Plan really become a program of action for the large numbers of cadres and people. Firmly grasping the theme of reform while studying and publicizing the documents of the Fourth Session of the Sixth NPC, we must enable the cadres and people to familiarize themselves with the main aspects of reform during the Seventh 5-Year Plan, persist in the general objective and basic direction of reform, organically combine the enterprising spirit of a pioneer in forging ahead with cautiousness and solid work, and correctly integrate immediate with long-range interests and local with national interests, thereby ensuring a healthy development of reform. Since last year, many localities have organized report meetings, and principal leaders at various levels have visited colleges, universities, and some middle schools to attend discussion meetings and listen to public opinion. With a clear objective in mind during the meetings, the leaders answered questions of common concern among the masses, as well as cleared their doubts. This is an effective way of conducting education on the situation and policies, improving leadership workstyle, and encouraging self-study among leading cadres. It should become a system and be continued for a long time to come.

Another important task of ideological and political work is to bring about a fundamental improvement in general social conduct in order to create a healthy social environment for the reform and modernization program. To fulfill this task, much needs to be done, but it can be summarized as cultivating healthy practices and eliminating unhealthy ones. On the one hand, we should energetically commend the exemplary deeds of advanced individuals and units on various fronts, publicize their civilized, healthy, positive, and enterprising spirit and their dedication to modernization, and conduct education, in various forms welcomed by the people, in patriotism and collectivism, in the four cardinal principles, and in communist ideals, morality, and professional ethics. On the other hand, we should earnestly rectify unhealthy tendencies, clamp down on improper activities that corrupt social conduct, and severely punish serious criminal offenses and economic crimes according to the law. In commending and emulating advanced individuals and units, we should stress actual results and guard against formalism, especially the never-ending visits to advanced individuals and units which created a heavy burden on them. In rectifying unhealthy tendencies and striking at serious economic crimes, we should take firm and prudent action, persist in seeking truth from facts, and correctly apply the policy. Those who should be punished according to the law must be duly handled, and should never easily get away with their wrongdoings. At the same time, we should protect the initiative of cadres and people to develop the economy and encourage their boldness in work and their sense of responsibility. It is necessary to check some units, in which healthy practices are not encouraged nor publicized, while unhealthy ones are rampant and not eliminated.

The key to intensifying the building of socialist spiritual civilization and rectifying unhealthy tendencies lies in the exemplary role of leading organs. Most functionaries in our government organizations at various levels serve the people earnestly, and their achievements are remarkable. However, serious corruption does exist in a few localities and units. Aside from an insiginficant number of violations of law and discipline, a rather serious problem can be found in some administrative departments and institutions who have forgotten the fundamental goal that the people's government should serve the people and grassroots, and have used their powers to try, by hook or by crook, to make money, including setting up business and running enterprises, extracting fees without approval, and taking "rebates." Another rather serious problem is the extremely irresponsible bureaucracy which has caused grave damage to the country and the people. These negative and undesirable activities have undermined the prestige of government organizations and corrupted social conduct. Therefore, to bring about a fundamental change for the better in general social conduct, it is necessary to start by rectifying the unhealthy tendencies in leading organs and investigating and handling cases involving economic crimes and dereliction of duty by leading cadres. The provincial people's government and provincial organs, in particular, should set a good example for people throughout the province. Governments at various levels should overcome resistance and support the discipline inspection commission and political and judicial departments in their investigations. Whoever is involved should be punished according to the law and discipline. Government functionaries should not be allowed to shield each other. We are convinced that so long as leading organs and cadres at various levels assume a serious and earnest attitude and make solid and relentless efforts to rectify unhealthy tendencies and investigate major and serious cases, we will surely be able to achieve a fundamental improvement in general social conduct.

The question of cadres' workstyle and general social conduct is ultimately a question of human consciousness. Unhealthy tendencies, violations of law and discipline, and immoral, uncivilized, and unhealthy activities are inseparable from selfishness, backwardness, and stupidity. In the final analysis, the building of socialist spiritual civilization is to help people foster a correct outlook on the world and life, learn the way to scientifically, morally, and aesthetically distinguish between right and wrong, build up their scientific and general knowledge, and combat selfishiness, backwarndess, and stupidity. Governments at all levels, on all fronts, and in all quarters of the community should attach great importance to raising human consciousness. It is necessary to step up and improve the publicity, education, and study of Marxism. Cadres at all levels should diligently study theory, and arm themselves with Marxist theory and the party's line, principles, and policies in order to raise their ability to discern and resist erroneous ideas. As education plays a decisive role in raising human consciousness, schools at all levels and of all kinds should conscientiously implement the policy of developing students in an allround way--morally, intellectually, physically, and aesthetically--and should appropriately increase the amount of manual labor in the curricula. A teacher should impart knowledge as well as ethics to the students so that they can achieve allround development and become a new generation of people with noble ideals, morality, general knowledge, and discipline. In order to struggle against stupidity and superstition, scientists should not only work for economic development, but also strive to popularize scientific knowledge, spreading such natural and social sciences as astronomy, geography, medicine, pharmacy, health, birth control, environmental protection, aesthetics, and law; and people engaged in literature, arts, press, publications, radio and TV broadcasting, and other cultural departments, who shoulder an especially important mission in building spiritual civilization, should provide still more and better intellectual products for raising the general knowledge, moral standards, and ideological awareness of the people.

Intensification of education in democracy and the legal system and popularization of legal knowledge are fundamental ways to prevent crime and coordinate the efforts of all quarters to improve public order. In carrying out work in this field, it is necessary to make the large numbers of cadres and people, especially leading cadres at all levels, familiarize themselves with the laws and conscientiously observe law and discipline. Law enforcement departments should set good, law-abiding examples to ensure that laws are observed, that their enforcement is strict, and that lawbreakers are dealt with.

While accelerating their modernization and regularization and becoming more revolutionary, PLA and People's Armed Police units in Zhejiang have performed their duties diligently and contributed greatly to building material and spiritual civilization, safeguarding coastal defenses, and maintaining public order. On behalf of the provincial people's government and the people of Zhejiang, I extend warm regards and heartfelt gratitude to them. During the new 5-year plan period, we will further improve our work of supporting the Army and giving preferential treatment to army dependents and in settling demobilized and retired armymen, and energetically support the PLA and the People's Armed Police Force in their endeavor to accelerate their modernization and regularization and become more revolutionary. We will also successfully restructure militia organizations, reform their training, and upgrade their equipment.

It is necessary to do a good job in overseas Chinese affairs and the work on Taiwan; further implement the policies regarding overseas Chinese, their relatives, and families of personnel who have gone to Taiwan; and increase the contacts with those overseas in order to revitalize the Chinese nation and promote the great undertaking of unifying the motherland.

Fellow deputies:

Realization of the Seventh 5-Year Plan will bring about tremendous changes in Zhejiang's economic and social outlook, and this concerns the vital interests of the people of the whole province. As this year is the first year of the Seventh 5-Year Plan, the trumpet has already sounded for winning new victories. Realization of the plan will depend on all workers, peasants, intellectuals, cadres, PLA units stationed in Zhejiang, armed police units, public security cadres and policemen, democratic parties, people's mass organizations, and patriots. Our task is formidable. Let us get mobilized and, under the leadership of the CPC Central Committee, the State Council, and the Zhejiang Provincial CPC Committee, work with one heart and one mind and with our wisdom, intelligence, and diligent labor in striving for the victorious fulfillment of the Seventh 5-Year Plan.

FUJIAN GOVERNOR REPORTS TO 6TH PROVINCIAL PEOPLE'S CONGRESS

Reviews Sixth 5-Year Plan

OW091025 Fuzhou FUJIAN RIBAO in Chinese 16 May 86 p 2

[Text] In his report to the Fifth Session of the Sixth Fujian Provincial People's Congress, Governor Hu Ping made a comprehensive review of the implementation of our province's Sixth 5-Year Plan. He said: During the period of the Sixth 5-Year Plan, our province carried out the principle of readjusting, restructuring, consolidating, and improving the economy. In our foreign economic activities, we carried out special policies and took flexible measures. The targets set in the Sixth 5-Year Plan were met, and gratifying changes appeared in our province's economic and social outlook. The past 5 years were a period marked by a significant advance of our province in exploring ways for urban and rural economic structural reforms. They were 5 years of our province's economy changing from a closed to a semiclosed state, and then to an open state. They were also 5 years of our province's economy being extricated from a poor and slow-developing state and gradually catching up with the pace of the nation's economic growth.

The report states: During the Sixth 5-Year Plan, our province's economy showed sustained, steady, and balanced development at a rather quick pace. Our gross value of industrial and agricultural output increased by an average 12.6 percent annually. The annual growth rate of the gross domestic product was 11.2 percent, and that of domestic income 11.4 percent. All these rates exceeded the national averages. During these 5 years the agricultural output value increased at an average rate of 11.8 percent annually, also higher than the nationwide average for the period. As for industrial output value, the annual growth rate averaged 13.1 percent, surpassing the preset target of 7.2 percent. In particular, production of consumer goods, including food items, textiles, garments, household electric appliances, and daily necessities, all doubled, and their varieties and designs increased remarkably. In the latter stage of the Sixth 5-Year Plan period, we paid attention to tightening macroeconomic control while invigorating the microeconomy, resulting in greater economic benefits for society. At the same time, major economic sectors were brought into balanced development, and the accumulation rate was maintained in the region of 26 percent, a rather reasonable rate. All this played a significant role in ensuring the sound development of our province's economy.

The report states: During the Sixth 5-Year Plan, our province achieved fruitful results in implementing special policies and flexible measures in dealing with foreign economic activities. Our economic relations, trade, and technological exchange with foreign countries and regions were vigorous. Our province had economic and trade relations with 124 countries and regions in the world. The volume of imports and exports totaled $3.39 billion, or 1.5 times the total for the previous 30 years. Contracts for utilizing foreign capital amounting to $800 million were approved, and $300 million of foreign capital was actually put to use during the period in question. A total of 793 contracts for joint investment projects, cooperative projects, and projects exclusively using foreign capital were approved. Of these, 368 have already become operational. We fully exploited one of our province's strong points, namely, it being the native home of a large number of overseas Chinese, by encouraging these overseas Chinese to return to make investments. This brought economic prosperity to those localities that are their native places. In the meantime, we maintained extensive contacts with international banking organizations and used international loans rather successfully in building a number of major projects such as the Xiamen international airport, the Shaxikou hydroelectric power station, and the Shunchang cement plant. The Xiamen special economic zone made conspicuous efforts to strengthen the building of its infrastructural facilities. Fuzhou accelerated its pace of economic development as a city opening to the outside world. In the Mawei economic and technological development zone, initial conditions were created for attracting foreign investment. In the triangular open zone in southern Fujian, plans and arrangements were made to promote production to meet the requirements for developing trade, industry, and agriculture. In addition, our province made considerable progress in obtaining contracts for construction projects in foreign countries, promoting labor cooperation with foreign partners, and developing tourist industry. Also, friendly exchanges with foreign countries increased.

During the Sixth 5-Year Plan, our province made considerable advances in capital construction and technological transformation. The amount of fixed asset investment made in enterprises owned by the whole people during these 5 years totaled 10.2 billion yuan, equal to the total for the three preceding 5-year plans. Capital construction investment projects totaling 7.3 billion yuan were completed. New fixed assets that came into being during this period amounted to 4.9 billion yuan. Forty-four big and medium-sized projects began operation after being fully or partially completed. Building basic energy and transport facilities were emphasized. Progress in technological transformation and technological imports was greatly accelerated. A total investment of 2.64 billion yuan were made in upgrading various facilities. Over 4,000 technological transformation projects, including 320 projects that involved technological imports, were completed during this period.

The report said: The period of the Sixth 5-Year Plan saw improvement in our province's financial condition. Revenue for these 5 years totaled 8.23 billion yuan with an average annual growth rate of 10.3 percent.

Both the increase in revenue and its growth rate were higher than those of any of the previous 5-year plans.

The report continued: The period of the Sixth 5-Year Plan also saw considerable development of science, technology, education, and various cultural undertakings. Our province spent 2.99 billion yuan for operating expenses in the fields of science, technology, culture, and education, the largest sum for such expenses for a 5-year period since the founding of the People's Republic. Achievements were made in solving key problems in science and technology and in applying scientific and technological research results. Awards were given to 252 successful scientific and technological research projects and to 51 other projects that were considered successful in promoting the application of research results. The contingent of scientific research workers continued to expand. In 1985 the number of those engaged in research work on natural science and technology and those engaged in social science research totaled 308,900, an increase of 154,600 above the number in 1980. Education developed at a rapid pace. During the 5 years, 116,600 people graduated from institutions of higher learning and secondary specialized schools. Adult education was in an unprecedented thriving state. Secondary education was restructured to a fairly great extent, and the work of popularizing primary education made new progress. Great achievements were scored in literature and art, press and publication, radio broadcast, movies, television, public health, and athletics.

During the Sixth 5-Year Plan, the market was brisk in both urban and rural areas of our province, and there was remarkable improvement of the people's living standards. The volume of retail sales in the province showed an annual average growth rate of 14.6 percent. During the 5 years jobs were provided to 680,000 people in cities and towns. In 1985 the average amount an urban resident spent on living expenses was 721 yuan, exceeding the 1980 level by 330 yuan. The annual increase in this expense averaged 7.5 percent, after adjustment is made for rises in commodity prices. In 1985 the net income of each peasant averaged 396 yuan, or 224 yuan more than the 1980 figure. The annual rate of increase averaged 16.3 percent, making these 5 years a period of fastest growth of such income since the founding of the People's Republic.

Views Plan to Help Poor Localities

OW090720 Fuzhou FUJIAN RIBAO in Chinese 16 May 86 p 2

[Text] In his report to the Fifth Session of the Sixth Provincial People's Congress, Governor Hu Ping talked about the planning to help poor localities in old revolutionary base areas, minority nationalities areas, remote areas, and coastal islands and about the regional economic arrangements.

Hu Ping said: The draft Seventh 5-Year Plan has made appropriate arrangements for the development of poor localities in the old revolutionary base areas, minority nationalities areas, remote areas, and on coastal islands.

Hu Ping pointed out: In accordance with the principle of taking full advantage of strengths and reasonably readjusting the economic structure, our local economic arrangements take into consideration both the development of better areas and support for poor areas. The coastal areas where the commodity economy is more developed, the industrial foundation is better, the technical level is higher, and transportation is more convenient are required to develop new pioneering, technology-intensive industries, and develop the economy which is oriented toward the outside. The poverty-stricken mountainous areas where resources are comparatively richer, the technical level is low, and the commodity economy is underdeveloped will be given support in terms of construction projects, funds, and materials as well as in policy, so that they may conduct technical transformation and technological importation faster and have greater ability to develop their economies. We must step up the building of basic facilities in the mountainous areas to promote greater development of the commodity economy there. At the same time, we must develop the lateral economic association between the coastal areas and the mountainous areas, between prefectures, and between cities so that both the coastal and mountainous areas can give full play to their respective strengths, draw from each other's strengths to offset weaknesses and promote each other.

Hu Ping said: During the Seventh 5-Year Plan period, the task to help old revolutionary base areas, minority nationality areas, remote areas, and coastal islands free themselves from poverty and become well off should be listed in the important agenda of governments and departments at all levels as a major task. According to the plan's requirement of "freedom from poverty in 3 years, removal of the labels in 5 years, and offering contributions in 8 years," we must try hard to fulfill it ideologically, organizationally, and in policy measures. Freedom from poverty means in 3 years the per capita net income of all peasant households in poverty-stricken townships and villages will surpass 200 yuan and, by 1990, over 300 yuan. First of all, we must help out those peasants who still have difficulties feeding and clothing themselves property. By removing labels in 5 years some counties which cannot make ends meet yet should have their labels of "financial subsidy recipient counties" removed and should strive to turn in to the state some surpluses. We must do the aid-the-poor work by freeing them from poverty and enabling them to become well off, by enabling both the people and the county to become well off, and by promoting both material and spiritual civilization. We must institute the system of responsibility for the objective of enabling people to be free from poverty and become well off. In addition to the provincial-level organs sending out a group of cadres to poverty-stricken areas to help them out in the first 3 years, the provincial leading cadres of governments at all levels and the provincial-level departments in charge of specialized work must all establish ties with selected localities for helping in shaking off poverty and becoming well off. Such ties should last for a few years and results must be achieved within a set period of time.

Assesses Population Growth Control

OW090835 Fuzhou FUJIAN RIBAO in Chinese 21 May 86 p 1

[Text] Governor Hu Ping, in his report at the Fifth Plenary Session of the Sixth Provincial People's Congress, pointed out that it is a strategic measure to have population growth under control. During the Sixth 5-Year Plan, Fujian Province achieved certain success in family planning, but did not do well in controlling population growth, for the major assessment indicators, such as the birth control rate, natural growth rate, and birth rate, all lagged behind other provinces and municipalities. The population's natural growth rate for the Seventh 5-Year Plan will be maintained at 10.5 per thousand. Since this will be a peak child-beering period, it will be difficult to control population growth.

Hu Ping said: Our province has many people but little land. The per capita farmland is only 7 fen [66.666 square meters]; therefore, it is imperative to control population growth. Otherwise, improving the people's living standard and better carrying out economic and cultural construction would be impossible. During the Seventh 5-Year Plan, governments at all levels must attach greater importance to birth control work by paying equal attention to birth control and economic work at the same time. It is essential to expand the family planning institutions, strengthen the organization of family planning work teams, and set up a sound system of responsibility. This should be gradually carried out in grassroots-level units; it is necessary to patiently and meticulously publicize education among the vast masses in order to constantly enhance their awareness of the need of implementing birth control; it is important to maintain the continuity and stability of all family planning policies as well as to promote the practice of having one child per couple. However, rural couples with practical problems should be allowed second births in accordance with policy. Second and third births in excess of the plan should be strictly prohibited. As the focus of family planning work is in the countryside, birth control should be carried out in conjunction with changing the backward customs and practices of rural areas, as well as with popularizing scientific knowledge, propagating the need of keeping down the birth rate and stressing eugenics in order to improve the quality of the population. It is imperative to make headway in family planning work this and next year so as to actually put population growth in our province under control.

LI XIMING ADDRESSES BEIJING PEOPLE'S CONGRESS 20 MAY

SK022320 Beijing BEIJING RIBAO in Chinese 21 May 86 p 1

[Text] After satisfactorily fulfilling all items on the agenda, the Fifth Session of the Eighth Beijing Municipal People's Congress was successfully concluded at the Great Hall of the People yesterday afternoon. The congress session called on the people of various nationalities and from various circles throughout the municipality to work with one heart and one soul and to unite as one under the leadership of the party and the government, to display the spirit of the foolish old man who moved the mountain and the pioneering spirit, to actively join in the great practice of the Seventh 5-Year Plan, to persist in reform, to pioneer the road of advance, and to exert efforts to successfully fulfill the Beijing municipal Seventh 5-Year Plan for economic and social development.

The executive chairmen of yesterday's congress session were the executive members of the congress presidium, including Li Ximing, Jin Jian, Xu Weicheng, Wang Jialiu, Li Qiyan, Li Guang, Wang Lixing, Wang Xian, Pan Yan, Ma Yaoji, Hou Jingru, Wen Jiasi, Pu Jiexiu, She Diqing, Chen Mingshao, Zhang Dazhong, Xing Jun, Rong Yi, and Xia Qinlin.

At 1500, Li Ximing declared the opening of the session. After that, Ma Yaoji chaired the elections. The congress session elected, through secret ballot, the president of the municipal Higher People's Court, the president of the municipal Intermediate People's Court, and the chief procurator of the municipal People's Procuratorate. Chief ballot supervisors Qi Jialian (female) and Li Qiangou announced the results of the elections.

The session then adopted a report on the municipal Seventh 5-Year Plan and a resolution on the report concerning the Seventh 5-Year Plan submitted by the Fifth Session of the Eighth Beijing Municipal People's Congress, a resolution on the 1986 economic and social development plan and on the 1985 financial accounts and 1986 financial budget, a resolution on the work report of the municipal People's Congress Standing Committee, and a resolution on the work reports of the municipal Higher People's Court and the municipal People's Procuratorate. The session also heard and endorsed a report given by Ma Dazhong, chairman of the motions examination committee of the congress session, on the examination of motions raised by deputies.

Comrade Li Ximing spoke at the end of the session. He said: During the session, all deputies have freely aired their views, and reviewed the remarkable achievements made in various fields during the Sixth 5-Year Plan period as a result of the efforts of the people throughout the municipality in upholding reform and striving to explore, to pool the wisdom and efforts of all, and to work hard. They have planned and formulated a magnificent blueprint for developing the capital during the Seventh 5-Year Plan period. This congress session will exert great and profound influence on the capital's socialist modernization cause.

Comrade Li Ximing said: This session has brought democracy into full play and the deputies have conscientiously performed their duties as the people's deputies and exercised the rights of the people's deputies with a high sense of responsibility. In the course of examining and discussing all reports, the deputies have offered many pertinent and valuable ideas and suggestions. All deputies have put forward many constructive ideas for strengthening urban construction and management of the capital; developing educational, cultural, and public health undertakings; improving service attitude and raising service quality; ensuring vegetable supplies; developing agriculture in the suburban areas; improving the democratic and legal systems; exerting continued efforts in dealing blows to serious economic crimes and criminal offenses; and strengthening the building of spiritual civilization.

These ideas fully embody the concern, support, and wishes of the people throughout the municipality for the construction of the capital. These ideas will serve as a driving force for promoting all future work in Beijing and for realizing all objectives and tasks during the Seventh 5-Year Plan period. He expressed the hope that all deputies would continue to conscientiously supervise and examine all fields of work in Beijing in the future and give criticism and suggestions at any time. The municipal People's Congress Standing Committee, all district and county People's Congress standing committees, and the people's governments at all levels should create conditions for the deputies to perform their duties and make things convenient for them, and conscientiously approach and properly handle the ideas and suggestions raised by deputies.

Comrade Li Ximing emphatically pointed out: The Seventh 5-Year period is a crucial period for reforming the economic structure of our country. This is the first year for implementing the Seventh 5-Year Plan and doing this year's work successfully will be of vital importance. At present, the political and economic situations in Beijing Municipality are good. However, we should also realize that we still have to face many arduous tasks and difficulties. We should actively publicize and earnestly implement the guidelines of this session, uphold the correct orientation of reform, and continue to improve various reform measures. On the premise of grasping the two civilizations simultaneously, we should give priority to prominently grasping the spiritual civilization. We should also vigorously strengthen ideological and political work, further improve the system of holding the people's congresses and other democratic forums, be good at applying legal means to manage economic and other undertakings, continue to march along the path of the four directives and the 10 instructions of the central authorities, mobilize the people throughout the municipality, unite with them, display the spirit of the foolish old man who moved the mountain, work with one heart and one soul, pioneer our road of advance, and strive to build the capital of the great motherland into a better and more beautiful place.

In his speech, Comrade Li Ximing also said: The deputies thank Xue Guanghua, the former president of the municipal Higher People's Court, and Wang Zhenzhong, the former chief procurator of the municipal People's Procuratorate, for their contributions to building the legal system in the municipality during their terms of office.

Responsible persons of the municipal CPC Committee, the municipal Advisory Commission, the municipal People's Congress Standing Committee, the municipal government, the municipal Higher People's Court, and the municipal People's Procuratorate, as well as the responsible persons of various departments, commissions, offices, and bureaus; some general companies; and the various district and county People's Congress standing committees and governments attended the session as observers. Some NPC deputies elected from Beijing also attended the session as observers, among them being Dong Jianhua and Zhang Binggui, members of the NPC Standing Committee.

The congress session came to a successful end amid the magnificent playing of the national anthem.

NEI MONGGOL'S ZHANG SHUGUANG INSPECTS BANNERS, COUNTIES

SK071156 Hohhot Nei Monggol Regional Service in Mandarin 1000 GMT 6 Jun 86

[Text] In mid-May, accompanied by Tian Congming, deputy secretary of the regional CPC Committee, Zhang Shuguang, secretary of the provincial CPC Committee, made an inspection tour of some banners and counties in Ih Ju and Ulanqab Leagues to discuss how to [words indistinct] and help the people end poverty and become prosperous.

Zhang Shuguang and other leading comrades first went to Jungar Banner to inspect the [words indistinct]. After hearing the report by a responsible comrade of the banner, Comrade Zhang Shuguang said: Ending poverty, unloading the burdens, planting trees, and breeding cattle and sheep are a way of economic construction for Jungar Banner. Comrade Zhang Shuguang said: (Ningtiao) is a superiority of Jungar Banner. We should mobilize the people throughout the banner to vigorously plant (Ningtiao) in order to build the banner into a (Ningtiao) base in 3 to 5 years. After hearing the report by a responsible comrade of the headquarters of the Jungar coalfield, Comrade Zhang Shuguang praised him for his [words indistinct] policy implemented at (Yongqigou) in (Gaole) township. In developing the Jungar coalfield, there are many favorable conditions and a bright future. The development of the Jungar coalfield will promote the penetrating development of the local economy. In developing this project, many feasibility studies have been conducted which have avoided blindness and duplication in this regard. [Words indistinct] Comrade Zhang Shuguang said: We should overcome the idea of the small-scale economy, give consideration to long-term development, and make early arrangements for overall construction.

In Qingshuihe County, Comrade Zhang Shuguang inspected the (Jiangchun) enamel plant, the (Yangjiayao) water and soil conservation and afforestation project, [words indistinct] processing plant in (Wangguiyao) township, and (Jibo) grass farm. Zhang Shuguang said: Qingshuihe County should exploit its favorable conditions in tree- and grass-planting and forage grass processing, should take advantage of its superiority in [words indistinct] to develop animal husbandry, should develop town and township enterprises which serve the neighboring cities and large enterprises, should attend to developing water conservancy and power industries, and should build itself into a typical county which integrates agriculture with animal husbandry, [words indistinct] links up the places outside and inside the Great Wall, and facilitates the flow of economy on both sides of the Huang He. To this end, we must adhere to the principles of seeking truth from facts, acting according to our capability, and [words indistinct].

During his inspection tour of (Helin) County, Zhang Shuguang said: We have already made a good beginning in implementing the principles of developing diversified occupations with stress on forestry and animal husbandry. [passage indistinct] Comrade Zhang Shuguang said: We should study the strategy for the county's economic development. The 30-odd banners, counties, and cities across the region should all have their own respective characteristics, and these respective characteristics should form the special features of Nei Monggol. [words indistinct]

In Liangcheng County, Zhang Shuguang, in line with the specific situation of Liangcheng County, called on the county to take the road of supporting animal husbandry with agriculture and promoting agriculture with animal husbandry. Comrade Zhang Shuguang said: We are now in the period of reform. Therefore, we leading cadres at all levels should attend to combining the principles and policies of the central authorities and the region with the work of localities. [words indistinct] He said: In implementing the principle of developing diversified occupations with stress on forestry and animal husbandry, we should be good at accounts. We should pay attention to tree- and grass-planting, just as they do to grasping grain. Our policies should encourage tree- and grass-planting, just as they encourage the growing of grain.

After hearing the report in Zhuozi County, Zhang Shuguang and other leading comrades pointed out: Leaders at all levels must follow the principle of taking one step and looking around before taking another and the principle of grasping forestry in the future, grasping animal husbandry at present, and grasping the work of becoming prosperous within this year.

GANSU LEADERS SPEAK ON ECONOMIC WORK ISSUES

HK080211 Lanzhou Gansu Provincial Service in Mandarin 2200 GMT 7 Jun 86

[Excerpts] The Gansu Provincial Government held a plenary meeting from 5 to 7 June to analyze the current economic situation and study and make arrangements for economic work in the next few months, especially in June, July, August, and September. The meeting called on the people of the province to strive for new victories in economic construction this year.

This year the province has been short of capital and raw materials, and many problems have been encountered in industrial production. In the face of these realities, the departments concerned have promptly studied and formulated corresponding policies, measures, and methods, with the result that industrial production has maintained a good momentum of steady development.

The agricultural situation is also relatively good. Thanks to correct policies and sound work, the sown area of grain is larger than last year. There are ample supplies of chemical fertilizer and agricultural chemicals. The foundation has been laid for a bumper harvest this year.

Comrade Li Ziqi addressed the meeting on the morning of 7 June. Speaking on questions of economic structural reform, he said that reform is a social systems engineering project on a vast scale which requires a great deal of pioneering work. There are no previous experiences to which we can refer, nor are there any ready-made models to copy. We can only proceed from reality and feel our way forward in practice.

Li Ziqi demanded that the leaders at all levels correctly distinguish between the new problems that occur in reform and unhealthy trends. They must take a firm and clear-cut stand in supporting reform, enthusiastically project the enthusiasm of the reformers, and act as their good backers, to ensure that economic structural reform in Gansu will advance along the correct track.

Governor Jia Zhijie delivered a summation at the conclusion of the meeting. He said: Although industrial output in the first 5 months of the year increased compared with the same period last year, we have not yet caught up with the rate of progress required by the plan. The cadres and workers must have a sense of urgency. They must implement various measures to ensure the fulfillment of the year's tasks.

Comrades Hou Zongbin, Ge Shiying, Lu Ming, and Zhang Wule also spoke at the meeting.

ECONOMIC DEVELOPMENT ZONES

FORMATION, STRUCTURE OF OPEN COASTAL ECONOMIC ZONE

Shenzhen SHENZHEN TEQU KEJI [SCIENCE AND TECHNOLOGY OF SHENZHEN SPECIAL ZONE] in Chinese No 2 (Apr-Jun) 85 pp 2-6

[Article by Chen Zhaowu [7115 5128 2430], Jinan University professor: "Forms and Structures of the Open Door in China's Coastal Areas"]

[Text] Opening up to the outside is a long-term national policy designed to stimulate China's economy. Work began in 1979 with the foundation of the special economic zone [SEZ], and then on the basis of the remarkable results attained and the summation of the SEZ experience, was followed by opening up 14 coastal cities and Hainan Island, and the designation of the Zhu Jiang and Chang Jiang deltas and the Southern Fujian Xiazhangquan Triangle as open coastal economic zones. In the future this will be gradually expanded to include the eastern Liaoning and Jiaodong peninsulas in the north. China's open area along the Pacific Coast has already taken on a preliminary structure, stretching from the Bohai Bay and Dalian in the north, and south to the Beihai Sea.

The open area runs through four SEZ's, 14 coastal cities, Hainan Island and 3 open economic zones on the coast, forming the forward position of China's open door policy. Within it is a network of crisscrossing relationships connecting the outside to the interior. The region, which has the form of a giant fan radiating outward, takes the SEZ's and open cities as its centers, and will stimulate the economy of the coastal area and develop the economic potential of the interior.

The opening up of economic development zones along the coast is a major strategic concept in the promotion of modernization in China, and has become increasingly noticed by people at home and abroad. How to deepen our theoretical understanding of this concept and what role the development zones will play are important issues that should be studied.

I. The Opening up of Economic Development Zones Is a Major Policy Decision That Goes Along with the Tide of History and Requires a Global Outlook

The open door policy cannot be understood as a temporary expedient. It must be understood in terms of historical trends and developments and of global economic strategy, especially the rapid revolutionary developments in technology. Otherwise we will not be able to gain a more profound comprehension of this far-sighted and sagacious policy.

The internationalization of production and exchange and the constant intensification of international economic relations worldwide is a historical law in the development of human society. The founders of Marxism pointed out long ago that due to the opening of world market, "production and consumption in every nation has become global in nature," and that , "self-sufficiency and isolation have been replaced by relations of mutual dependence and intercourse among all nations."[1] This is an inevitable objective tendency which takes as its background a highly developed commodity production. The process of the internationalization of production and exchange has accelerated increasingly since World War II, as have the relationships and interdependence among nations. Any nation in which the development of the forces of production separates itself from the world economic network will surely fall into a state of stagnation. This point has become increasingly clear with the rapid development of science and technology on a global level.

However, despite the fact that the above is uncontestable, basic, common sense, under the influence of "leftist" ideology, isolation and self-sufficiency were distorted to mean "regeneration through one's own efforts," and developing international economic relations were viewed as bringing in capitalism, which totally confused everyone. Therefore, the implementation of the open door policy requires the prior thorough elimination of the "left" ideological influence.

The "Decision" of the 3d Plenum of the 12th CPC Committee clarified the nature of the socialist economy as one belonging to the commodity economy, and further brushed aside theoretical obstacles hindering our attaining a more profound understanding of the open door policy. We now realize that opening up is an inevitable requirement necessitated by the development of the commodity economy. Commodity production needs markets, and will inevitably find a path to the world market. Isolated markets cannot resist the tidal wave attack of the development of the commodity economy. We cannot set up internal barriers in our socialist commodity economy; nor can we attempt to do the same thing and isolate ourselves from foreign markets. Breaking isolation is a necessary condition in the acceleration of the development of China's socialist commodity economy.

This forms the general theoretical basis for China's implementation of the open door policy. What needs to be discussed now are not only questions relating to the development of the national economy via the open door, but also questions regarding the reasons for creating SET's and the open coastal economic development zone. This policy implies the implementation of a series of special economic policies within the bounds of a specific geographical area. The resulting open economic development zone differs from most open markets in the country. Why must we adopt these forms? What is the broader significance of the creation of the coastal open economic development zone? As the usual theories are insufficient, it is necessary to study in depth the background and specific content of this major policy decision.

---

1. Selected Writings of Marx and Engels Vol 1, pp 254-255.

First, it should be understood that the internationalization of production has been accelerated by great developments in science and technology. Science and technology as part of the forces of production are having an increasingly greater effect on the economic development of all nations on a global scale, particularly in this day and age when we are faced with a new technological revolution. Scientifically backward nations will have to seize the opportunity and take effective measures to rapidly narrow the gap between them and the developed nations. This is what is meant when we speak of the need to adopt effective policies in the face of the challenge, and is a strategic task in the promotion of modernization in China. To accomplish this, China must greatly develop international economic and technological relations and enable our production and exchange ot participate in world markets more broadly and deeply. We must also implement special policies in certain regions to strengthen these relations.

The special zone should act as a catalyst to accelerate the absorption and assimilation of advanced technologies. The SEZ's and open economic development zones have been created to meet just that need and to act as four "windows" to the outside. The open economic development zones are a part of China's centralized, open socialist economy, and form a forward position for the implementation of certain specific tasks. Their creation should become China's major strategy in meeting the new worldwide technological revolution, and is a vital component part of strategic plans to promote socialist modernization.

The economic role of the Pacific region has grown increasingly since the 1960's. The world economy has already shown signs of shifting its center toward it. In the southern arc of the Pacific, the primary economic forces will be Japan and China. Faced with strong economic rivals, China's ability to develop into an economic center in the Pacific largely depends on the capacity of our coastal areas to fully develop their giant economic potential. Therefore the creation of the open economic development zone will also play a role in making China a future economic center, and should include a returned Taiwan and Hong Kong.

The establishment of SEZ's and open economic development zones should also be linked with policies to compete internationally for advanced technologies and to increase the pace of our own economic development. Successful experiences of foreign countries in this regard should be studied. Many developing and developed nations have established special open economic zones such as free trade zones, tax-free zones and export-processing zones in their coastal areas or in transportation centers. For example, 60 percent of the FRG's foreign trade is conducted via the free trade zones of Bremen and Hamburg. America uses its 84 customs free foreign trade zones to attract foreign commerce. The export-processing zones of Singapore, South Korea and the Philippines are even more well-known. The export-processing zones and industrial parks of our own Taiwan have made much progress in the import of foreign capital and technology and in the development of foreign trade. Our comprehensive SEZ's, open coastal cities and economic development zones have been created with these competitive foreign models in mind, but have also been designed to meet our own national needs and conditions.

II. Present Advantages of the Open Economic Development Zone

1. Geographically, the zone is a pivotal area linking China to international markets, and itself to the vast hinterland. The zone between Dalian and Lianyungang forms the center of the transportation network linking China with Europe, Asia, Japan and South Korea.

The zone belonging to the rich Shanghai economic zone stretching from Nantong to Shanghai and Ningbo receives support from the rich and fertile Chang Jiang Delta and is near the East China Sea oilfields. Shanghai is also China's largest foreign trade seaport, making this area the center of the open economic development zone.

The zone from Wenzhou through Fuzhou to Guangzhou, Hainan Island and Beihai in Guangxi, and including Taiwan and Hong Kong, occupies an important position in relation to Southeast Asia. Nearly half of all the SEZ's and open ports are located here, making it a crucial part of the open economic development zone. At the same time, Wenzhou, Fuzhou and Guangzhou are traditional light industry centers. Fuzhou is situated next to the Min Jiang basin and the "golden triangle" area of Zhj Jiang Xiazhangquan, while Guangzhou is located in the naturally rich Pearl River delta area, which gives this zone an important position in the entire open door policy.

The interior areas linked with the cities and ports in the open economic development zones, related information concerning natural resources and transportation advantages are listed in the chart below for reference.

2. The open economic development zone encompasses a series of ports with good conditions rarely seen in the world.

The zone contains many deepwater ports that do not freeze in the winter or silt up and that are safe harbors, such as Qinhuang Island, Dalian and Qingdao in the north. Ningbo and Zhanjiang are both good deepwater ports, while Wenzhou, Nantong and other locations all have good harbors. The annual handling capa-city of the 14 coastal parts is at 97 percent. It is clear that most of China's ports for the import and export of materials are located within the open zone.

3. The open economic development zone is also the nation's most advanced region in terms of science, technology, culture and education. It can take up the task of attracting and absorbing advanced technologies and modern knowledge. Twelve percent of the nation's scientists and technicians are located in the 14 coastal port cities, as are 17 percent of the institutions of higher education and technical secondary schools. The zone is not only a "window" for importation, but also a base for the cultivation of the new generation of modern talent.

4. Residents in a number of cities in the development zone have relatives overseas, which presents great opportunities for bringing in foreign currency. Guangzhou, Hainan, Shantou, Ningbo, Wenzhou and Shanghai, among other places, are major overseas Chinese centers. Some of these cities have traditionally

City	Hinterland link	Major Natural Resources	Transportation Advantages
Dalian	The northeast, Nei Monggol	Forests, grain, petroleum, coal, sea products, ship-building, tourism	Sea traffic with several hundred ports in 60 countries; land routes to Europe via the Siberian Railroad
Qinhuang Island	North China, the northeast	Petroleum, coal, tourism, sea products	Centralized export center for the north and northwest; China's longest oil pipeline
Tianjin	North China plain, the northwest, Nei Monggol	Petroleum, coal, sea products, chemical industry	Transportation hub for northern land-sea routes; its railroads stretch north and south; has over 20 sea lanes to 148 countries
Yantai	Shandong, the north	Sea products, mining, fruits	Near the Liaodong peninsula and the sea, well developed water transportation
Qingdao	Shandong, the north	Light industry, tourism, textiles	Sea traffic with 100 ports throughout the world, well developed railways and highways
Lianyungang	Northern Jiangsu, southern Shandong, Henan	Tourism, coal, sea products	Start of Longhai Railroad, most convenient port for the central plain and the northwest
Nantong	Provinces in the Chang Jiang basin	Light industry, textiles, tourism	Transportation heart of Jiangsu, point of transfer for sea and river routes
Shanghai	Chang Jiang delta and plains of its middle and lower reaches	An abundance of products in both hinterland and coastal zone, all industries, China's industrial heart	Transportation nexus for national sea, land and air routes, sea routes to more than 400 ports in 100 countries
Ningbo	Tong Jiang basin	Sea products, tourism, arts and crafts	International routes to Korea, Japan, Southeast Asia; a central area
Wenzhou	Ouh Jiang basin	Food products, arts and crafts, tourism, clothing, machinery	Links the southeast to the outside
Fuzhou	Min Jiang basin	Machinery, light industry, tourism	Sea routes to more than 20 nations and regions
Guangzhou	Zhu Jiang delta	Ship-building, light industry, tourism	Land, sea and air transportation hub for South China, close to Hong Kong and Macao, routes to 110 nations, regions and 535 ports
Shen Jiang	Northwest hub, Guangdong, the southwest	Mining, petroleum, semi-tropical crops	Port with closest sea routes to Singapore, Africa and Europe
Beihai	Guangxi, Guizhou	Mining, sea products, tourism	Major port of entry and exit in the greater southwest

had connections with foreign businessmen. This situation is particularly marked in the SEZ's. For example, an approximate total of 4 million people originally from Shantou reside in Hong Kong, Macao and in 34 countries and regions throughout Southeast Asia, Europe and America. More than 2 million overseas Chinese and foreign citizens of Chinese descent from Xiamen are scattered throughout the world. Almost every family in Shenzhen has relatives living in Hong Kong. Overseas Chinese and compatriots from Hong Kong and Macao are playing an important role in investing in the open cities. More attention should be paid in the future to absorbing more of this great overseas investment potential into the development zone.

5. The development zone has a fairly good industrial and commercial foundation, and industry has been developing rapidly in the last few years. This makes the zone more suitable to the implementation of the open door policy and to the effective importation and absorption of advanced technology.

Based on the above analysis it is easy to see that this arch-shaped region on China's Pacific coast has a potentially great role to play in the implementation of the open door policy and the promotion of modernization in China. If the zone can link up with Hong Kong and Taiwan to form a whole, by the turn of the 21st century, the cities in this region will be like a chain of splendid precious pearls matching that of any other country.

III. The Functions and Administrative Structure of the open Economic Development Zone

The various coastal cities and related hinterland areas along the long coast line of the development zone have different characteristics, but combine to form an integrated whole. Therefore, in the overall planning for the zone, the different functions of each area have to be considered and different administrative structures established.

Open zones can be classified into the following types depending on their primary foreign trade functions: the overall open zone, the trade-oriented type, a base, and the seaport transportation type. Each open city will emphasize different functions and develop in different directions according to its special characteristics.

A similar division according to function can be applied to the SEZ using however, different categories, such as the overall type, the export processing type, the free port type and the commercial and tourism type.

The current internal structure of the development zone is divided into three levels according to the depth of outward involvement—the SEZ, the open coastal city and the open coastal economic development zone. The degree of openness and flexibility of policies and measures for each level differ. At the same time, the three levels combine to form an outward radiating open fan-shaped whole.

We will now proceed to examine the above structures more closely:

1. Function and Structure in the Open Development Zone

The different categories can be divided according to function and structure as follows: 1) The overall open type of Shanghai, Tianjin and Guangzhou. The characteristics of these three cities are: they are economic urban centers for the entire nation; industry and commerce are highly developed; all industries are represented; they have traditionally been major ports for foreign trade. At the same time, science, technology and education are more developed here than elsewhere, and are managed fairly well. Therefore they should be developed in an overall manner in order to allow them to make full use of their multidirectional function. 2) The foreign trade type of Dalian, Qingdao and Ningbo. These three cities have always been excellent ports for the conducting of foreign trade. Water transportation is convenient and their hinterland areas have an abundance of natural resources, which can help promote the development of these cities into large-scale commercial seaports. At the same time they have a definite foundation in light industry, textiles, sea products and so on, which can be rapidly developed through foreign trade. 3) The base type of Fuzhou, Wenzhou, Nantong, Yantai, Zhanjiang and Beihai. These cities and their hinterlands have an abundance of natural resources, and can become bases for foreign trade. 4) The seaport transportation type of Lianyungang and Qinhuang Island. These cities have been typed according to their transportation tasks and special characteristics. Lianyungang is the starting point for the Longhai Railway and is linked to the northwest, making it the most convenient port of exit for that region. Qinhuang Island is the harbor for the export of materials from the north and the northwest, and for China's coal. China's largest complex of oil pipelines is also located here.

It must be pointed out however, that the classification of the open cities according to function and structure is not limited to the above fixed four categories. The advantages held by the open cities are multidimensional, and any one of them can develop into a position of greater relative prominence, leading possibly to the formation of other functions and categories.

Regarding the SEZ, Shenzhen and Zhuhai are overall special zones. Their commercial and tourism aspects tend to be marked, whereas Shekou in Shenzhen is primarily an industrial special zone. Shantou has also developed into an overall special zone, and has possibilities for development in agriculture. As the Xiamen SEZ expands to include the entire island it will develop more in the direction of a free port.

Concerning the functional structure of the open development zone, the following points should be noted: 1) The purpose of classifying according to function in the zone is to ensure the coordinated operation of the special separate functions of each component part in order to most rationally and effectively develop the zone's structure and function. As this has a direct bearing on the development strategies of all the open cities and SEZ's, more in-depth research should be carried out in consideration of the various conditions, advantages and future prospects for development of each open zone or area. In addition, the tasks of the entire development zone must be clearly determined in light of global strategy. From this, the exact function of each open area can be designated.

2) The functions and structure of the development zone must be able to adapt to the changing situation. The direction of the development of any open area can only be tested and corrected through constant practice. We must attempt to seek truth from facts and not rush to conclusions based on our subjective desires or assumptions. In addition, we must take into consideration new situations and factors of the coming few years, such as the return of soverignty over Hong Kong and the reunification with Taiwan, two important factors that require study.

Even if we take the Shenzhen SEZ as an example--despite its great successes in its 5 years of existence that have won widespread, the zone is still in a yet to be categorized transitional stage. Nor can its special economic characteristics, including the direction of its economic development, be said to be of a particular fixed type. As an overall special zone, its major functions still need to be studied more closely before being determined. For example, although Shenzhen's market is a triving one, it has not yet developed into the outward-facing type that had been originally conceived for it, and the export competitiveness of its industrial forces of production and products is not ideal. Therefore the zone's market can only be said to be in a transitional stage. The construction of the special zone requires a transitional period; it cannot develop a fairly large export capacity overnight. Also, a careful analysis has to be made of the conditions necessary for the smooth development of Shenzhen's entrepot trade. Therefore, the current problem is not avoiding making hasty decisions concerning certain economic phenomena and developments in the Shenzhen SEZ, but concerns rather research on how the zone shall continue to develop in the future and how to make full use of its advantages to further clarify its proper functions and emphasis. There are also new issues worth studying in-depth concerning the open cities.

2. Organizational Structure in the Open Development Zone

The basis for the classification of organizational structures lies mainly in the different special policies and limitations set by the state in the process of implementing the open door policy based on the different conditions existing in each open zone. Special policies and new management systems are to be applied in the SEZ's that are within the bounds set by the state.

More specifically, these special policies are primarily composed of the four following aspects: 1) The concentrated importation of foreign capital within the SEZ. The economic system of ownerhsip in the SEZ can tolerate a large proportion of joint capital ventures, cooperative ventures and totally foreign-owned enterprises. 2) The regulating role of the market in the SEZ's production and circulation can be widely implemented. 3) Preferential treatment can be accorded foreign businessmen in relation to taxes and the ease of entry and exit. The enterprise income tax is 15 percent. Customs taxes and commercial import taxes are wavied for bringing in equipment needed for investment for foreign-run enterprises. Export taxes and other industrial and commercial taxes are waived during the export of their products. 4) The SEZ economic system is not to be held to within the framework of the economy of the rest of the nation. Various reforms can be made and the SEZ has more autonomy, for example the right to review and grant approval of suggested projects for foreign investment. 5) A certain percentage of products manufactured by foreign enterprises can be sold within China.

After the second border is delineated, the SEZs can be opened up further. However, current income taxes are already lower than Hong Kong's 17 percent. Other taxes can also be waived.

The administrative type of Hainan Island is the same as the SEZ's and policies administered there are basically the same as those of the special policies of the SEZ.

The open city basically belongs to the first structural level. The set up of the economic and technological open area has to be clearly divided into different geographic regions where special policies similar to those of the SEZ are implemented in order to attract technology- and knowledge-intensive.

The further opening up of the 14 coastal cities means primarily the expansion of their autonomy, including the right to review and grant approval of foreign investment projects, and to give various types of preferential treatment to foreign businessmen.

The old urban districts of the 14 coastal cities and the Shantou and Zhuhai city districts all belong to the first structural type as regards the implementation of special policies.

The open coastal economic development zone, including the Pearl River Delta, the Chang Jiang Delta and Xiamen's Zhangquan triangle, shall, based on their different conditions, provide favorable treatment to foreign businessmen similar to that of the open cities to encourage them to invest in China. They will also have certain rights in regard to importing and exporting, such as the right to reduce or waive taxes on joint capital ventures and cooperative ventures.

The open coastal economic development zone is still in the preliminary stage of formation, and the laws of its construction and development have yet to be explored. These zones all have as their centers the open cities, and shall dispose of their economic forces in the "foreign trade, industry and agriculture" direction. The zones are directly situated within the bounds of the SEZ or open cities, and possess abundant natural resources and a fairly well developed industrial commercial and transportation network. Therefore, they have a greater role to play in the importation of foreign capital and technology and the development of foreign trade than most economic zones inland. The integral unity of the several open economic areas that compose the development zone is highly significant.

The three levels within the development zone must form a strong organic whole and must resolve the problem of balancing the whole picture with "special" interests. The effective coordination and full development of the various levels require a prior understanding of the entire situation; the component parts and levels should not work against each other. Overlapping importation can result in great losses. The various open zones and the SEZ have been set up primarily to promote development, especially of new industries. The open cities should take as their main task the reform of old enterprises, and the full development of the role of foreign trade and of their attached hinterland areas. The SEZ's and open cities should gradually create a complex network for the exchange of information, science and technology, and should become a link uniting the entire open zone. The open economic zone has a broad scope and requires a great effort to implement the relevant policies to turn it into an effective foundation for the open cities.

Economic and technological development in the open cities must be stressed, to allow them to give free rein to the development of their advanced new industries. In other words, this calls for the creation of a coastal "Silicon Valley" which can function as an important base for accelerating technological development in China. The establishment of economic and technological development areas in the open coastal cities is a policy decision that will play a vital role in meeting the challenge of the new world technological revolution, and will be a measure of how well the open cities implement the open door policy.

ECONOMIC MANAGEMENT

NEW METHODS TO ENLIVEN SHENYANG'S SMALL ENTERPRISES REPORTED

Beijing RENMIN RIBAO in Chinese 8 Jan 86 p 2

[Text] According to a report by SHENYANG RIBAO, Shenyang City has continuously probed new ways to invigorate small enterprises and has adopted several new policies and measures to instill life and vitality in the small enterprises. Over 4,000 small enterprises in the city, 96.7 percent of the total number of industrial enterprises, have currently extricated themselves from their predicaments.

Trial Implementation of Collective Management by Small State-owned Enterprises

Since 1984, Shenyang City has successively implemented the management method of "ownership by all people, collective management, taxation according to regulations, and sole assumption of responsibility for profits and losses" for 104 small state-owned enterprises. This has accelerated production development. The number of debt-ridden enterprises has been reduced by two-thirds, and the state's financial resources have been expanded. Moreover, the enterprises have improved their capability in self-transformation and self-development, and have established the stamina for further development.

Trial-implementation of the Bankruptcy Method for Collective Enterprises

In the past, we have supported the existence of some longstanding debt-ridden enterprises by such means as subsidy "transfusion." This has made the financial burdens of the state and local governments heavier and heavier. In February last year, Shenyang City drew up the "Regulations for Trial-implementing Bankruptcy for Urban Collective Industrial Enterprises." This put economic and legal pressure on those poorly-managed enterprises. In light of the spirit of the regulations, in August last year, the municipal people's government issued a "Bankruptchy Warning" to three enterprises, including the No 3 Agricultural Machinery Factory and the Explosion Protection Equipment Factory. The warning produced a tremendous impact on the above enterprises. Upon being warned, with the spirit of being masters of their own destiny, the staff members and workers of the entire No 3 Agricultural Machinery Factory consciously made joint efforts to rescue the enterprise. After a period of hard work, they brought about the best business state ever experienced since the factory went into operation, extricated themselves from their own predicaments, and embarked on the path of "revival."

Trial Implementation of the Shareholding System in the Collective Enterprises

Since the second half of last year, Shenyang City has trial-implemented the shareholding system in some collective enterprises. The shares of these enterprises consist generally of the state's investments, cooperative's investments, enterprise-owned funds and staff individual shares. The after-tax surplus of enterprise's profits is distributed proportionately among the shareholders. The shareholding system has closely linked the enterprise's economic benefits with the immediate interests of the staff and workers, thereby arousing the workers' enthusiasm in production.

Trial Implementation of Leasing Business Among Small Enterprises.

Currently, 37 industrial enterprises, nearly 1 percent of the city's small enterprises, have been leased to individuals for management. The benefits of these enterprises are much higher than the average level of the whole city.

Institution of Activities to Strive and Create "Small Giant Enterprises."

Last year, the city began to judge "small giant enterprises". The municipal people's government issued a certificate for and hanged a red factory plate on those factories which won the title of "small giant enterprise." These enterprises also enjoyed designated preferential treatments in such respects as wage distribution, profit retention, technological transformation, technology importation and materials distribution.

JINGJI YANJIU ON RURAL JOINT CAPITAL ENTERPRISES

HK020903 Beijing JINGJI YANJIU in Chinese No 3, 20 Mar 86 pp 60-94

[Article written in November 1985 by Li Lianjin [2621 6647 6651] of the Department of Political Education, Tianjin Municipal Teachers University: "The Role and Problems of Fund-Raising for Rural Enterprises"]

[Text] The emergence of industrial, commercial, transport, and various service enterprises operated with joint capital raised among the peasants is a new development in the rural areas of our country. This is also an important form of economic activity in the present stage of the drive to speed up socialist construction in the rural areas. However, our understanding of and attitude toward joint capital enterprises has become a new problem with respect to both theory and practice. Some people, including operators of joint capital enterprises, still have all sorts of opinions and misgivings. At the same time, the joint capital enterprises themselves are far from perfect. Therefore, it is necessary that we enhance our understanding, formulate corresponding policies suited to the actual conditions, and give these enterprises correct guidance so that they can better serve the development of the rural economy.

The following are some views on this issue, using the operation of joint capital enterprises in the rural areas of Tianjin municipality as an example.

I. The Situation and Characteristics of the Joint Capital Enterprises in the Rural Areas of Tianjin Municipality

Joint capital enterprises in the rural areas of Tianjin municipality have developed rapidly in recent years. According to statistics of the departments concerned, at the end of June 1984 there were 1,181 peasants' joint capital enterprises employing 18,052 people. At the end of 1984, the number of such enterprises rose to 3,374, employing 48,600 people. Development has been faster since 1985. At the end of September 1985, there were 5,524 enterprises employing 89,904 people. In some localities the development of joint capital associations has surpassed that of individually operated industrial and commercial enterprises. Joint capital enterprises have great variety in regard to production items and nature of business. In September 1985 there were 3,599 enterprises engaged in manufacturing, 178 in transport, 349 in repair and construction services, 927 in commerce, 92 in the food and beverage catering, 62 in service industries, 285 in repair and maintenance, and 32 in other lines of business.

The joint capital associations in the rural areas of Tianjin municipality are of several types: There are share-capital enterprises of a cooperative nature, joint enterprises owned by a small number of people who contribute the capital and employ staff and workers to operate their businesses, and individuals raising capital and employing staff and workers to operate their businesses. Different kinds of joint capital enterprises have different characteristics in terms of ownership, mode of distribution, and system of employment. They differ greatly from a collective economy. They are also different from a cooperative economy as it is generally understood. According to a survey we have carried out in several counties and some suburban areas, joint capital enterprises have the following characteristics:

First, regarding the substance and form of raising capital, joint capital associations are established through share-capital investments. Investments can be made in many ways: They can be cash, provision of expertise, provision of factory premises or shops, or provision of labor reckoned in terms of yearly wages. For example, the Gengxin Restaurant in Ji County was established with 5.5 shares by 6 percent households. One, the owner of the premises, contributed half of share by providing a shop worth 200 yuan; a cook contributed 1 share by providing his expertise, and the remaining 4 households each contributed 1 share by giving 400 yuan. The Jinnan metal welding factory at the south suburb station is another example. It was operated with joint capital raised by 17 percent households, with each household contributing 200 yuan. Two of the households, unable to contribute any cash, provided labor and contributed their wages by the end of the year as shares.

Furthermore, shareholders are allowed to make cross-trade and cross-locality investments. No limit is imposed upon the amount of share-capital and the number of shares, and investment is on a voluntary basis with shares being withdrawable at will (when shares are withdrawn, only share-capital, not the accumulated fund, is repaid). All these measures meet the demands of the peasants in the rural areas at present.

Second, joint capital enterprises can handle the ownership of share-capital more flexibly by adopting, generally speaking, the following two methods: First, retaining the investments of individual shareholders and issuing dividends to shareholders; second, repaying of share-capital within a certain period instead of issuing dividends to shareholders, but distributing the yearly profits according to work, realized in terms of differences in wages after the deduction of provident funds and community funds. At present, most of the joint capital enterprises in Tianjin municipality adopt the former method, which can be considered the basic method. A small number of enterprises adopt the latter method, which prevails nevertheless in some localities. For example, a number of joint capital enterprises in Tanggu locality practice the system of repayment of share-capital.

Third, the mode of distribution of profits of joint capital enterprises are many and varied. Some integrate the method of fixed wages (time wages or piece-rate wages) and that of dividend-sharing. Wages are fixed in line with the skills and contributions of individual laborers, with the high end monthly wages being 200-odd yuan and the minimum being 50 yuan plus. This widens the wage difference and embodies the principle of more pay for more work. The amount of dividend shared is relatively great. For example, the Fuxing Beverage Factory of Xiaofuzhuang village, Ji County, was operated with the joint capital raised by 20 peasant households, with each household investing 500 yuan, and employed 36 households (relatives and children of shareholders) to take part in production work. Dividends for each share in 1983 were 6,000 yuan, whereas the fixed annual wages of a worker was 1,000 yuan; share dividend was thus five times the wages.

Some adopt the method of integrating fixed wages, share-dividends, and labor bonuses. Compared with the above method, this method includes one more element: labor bonus. It should be noted that a labor bonus is not distributed equally among the people, but according to an individual laborer's wages; i.e., laborers with a higher level of skill and higher wages get more labor bonuses and vice versa. This method eradicates the procedures of assessment and reward and avoids the trouble which may be brought about by these procedures. The key to the successful implementation of this method is whether wages are fixed reasonably. However, the absolute amount of share dividends issued by enterprises which adopt the method of a labor bonus is still very large. For example, the Chuipinghu Canned Food Factory, Mashenqiao Brigade, Ji County, was established with joint capital of 2,000 yuan (500 yuan per share) by four peasant households in 1983 and employed a number of peasants in the same village. The average monthly salary was 45 yuan, plus a bonus of 10 yuan (totaling 55 yuan). The year-end profit was distributed in the proportion of 3:3:4; i.e., 30 percent as accumulated fund, 30 percent as share dividends, and 40 percent as labor bonus. In 1984, the profit of this factory was 72,000 yuan. According to the above proportion, the labor bonus amounted to 28,800 yuan, the share bonus 21,600 yuan, and the accumulated fund 21,600 yuan. As the number of employees was great, the average per capita labor bonus was 230 yuan, while the dividend per share was 5,000 yuan, more than 20 times higher than the labor bonus. When it is noted that the accumulated fund is to be owned by investors, the difference between the income of laborers and that of investors can be seen to be even wider.

Joint capital enterprises pay relatively high wages to technicians they employ. The Chaierzhuang Beverage Factory of Chutuling, Ji County, employed a technician from Quyang County of Hebei Province and paid him a monthly wage of 100 yuan in addition to expenses for his food and drink. Moreover, the technician drew 0.03 yuan for every bottle of beverage he produced (according to the estimate at that time, the net profit of each bottle of beverage was 0.06-0.07 yuan). The woodwork factory of Mashihe, Balitai, south suburb, paid a technician a monthly wage of 240 yuan.

Fourth, the employment systems of joint capital enterprises are also many and varied. The joint capital enterprises in the rural areas in Tianjin municipality adopt three employment systems. The first system is that all work is done by the investors themselves and no other people are employed. The second system is that work is basically done by investors, and when extra laborers are required, shareholders' relatives and children will be employed, with the number in proportion to share-capital. The third system is that, apart from the investors, their relatives, and children, some other peasants are also employed (some enterprises are employing as many as 150 people). The methods of employment are also varied. Some enterprises require people to work together in factories, paying either time wages or piece-rate wages. This method is adopted by most enterprises. Some enterprises employ individual workers to do processing work at home and pay them on piece-rate basis. For example, the Huazhongshu Sewing Factory of Nanfuying village and south suburb adopted the method of distributing processing work to different households. There are more than 20 processing points in the village. For each purse processed, a wage of 0.13 yuan was given. This method gives full play to the enthusiasm of every household and saves the investors expenses on premises and facilities.

All these facts show that the modes of operation adopted by joint capital associations in the rural areas of Tianjin municipality are really different from what we had in the past when we insisted that all means of production should be owned by the public, allowed no private ownership, allowed only distribution according to work, and allowed no share-dividends or labor bonus. The present type of joint capital enterprises conforms with the development of productivity in the rural areas and the ideological level of peasants and this is more acceptable to peasants, for such enterprises are full of strength and vitality.

II. The Role Played by Joint Capital Associations in Speeding Up Rural Economic Development

Peasants' joint capital associations emerged because there was a need to meet the demands of large-scale industrial and sideline production, large-scale processing of farm and sideline products, and large-scale provisions of other services. This kind of joint economy overcomes the limitations of the contract system by individuals and plays an important role in mobilizing peasants' idle money, concentrating human and material resources, and invigorating the rural economy. It provides a new channel for peasants to establish a better form of cooperative economy. Therefore, we should attach great importance to the development of peasants' joint capital economy.

First, establishing joint capital enterprises is an important way to mobilize idle money in the rural areas and to realize expanded reproduction.

The development of rural area construction in our country and the shortage of funds constitute a contraction. Following the growth of the economic strength of the state, it is of course completely necessary for the government to allocate more money to finance rural area construction. However, such allocations are always limited. The funds required by the rural areas for social construction, apart from being financed by the state, should be mainly provided by peasants themselves by tapping their own potential. Practice over the past few years has proven that the restructuring of the rural production mix and the operation of industrial and sideline production can be carried out with the capital raised by peasants, without the support or investment of the state. This has not only reduced the expenditure of the state, but has also increased its revenue through taxation. Therefore, at the present stage, joint capital enterprises serve as important channels for concentrating and generating funds and constitute an important way to realize expanded reproduction in the rural areas.

Pooling capital to start business is common in capitalist society. The bourgeoisie, through issuance of shares and establishment of share-capital companies, pool large amounts of idle money from the community, including the workers' limited savings, and establish large-scale enterprises such as railway companies, banks, and industrial and mining undertakings. This has promoted economic development and is still a common practice at present. Under the socialist system, it is also completely necessary to pool capital to accumulate funds and speed up socialist construction. The practice of pooling capital in recent years in China has proven that this is an important way to accumulate funds. It can be applied to rural areas as well as urban areas. Under the condition in which socialist public ownership is in the predominant position and state-owned funds are in absolute control, it is practicable to accelerate the socialist modernization program by extensively pooling capital from society.

Second, pooling capital for industrial and sideline production creates employment opportunities for the surplus labor force in the rural areas and makes it possible for some competent people to lead a greater number of people toward common prosperity.

Joint capital enterprises help create more employment opportunities and put the labor force under the leadership of able people. Therefore, they have a wide scope for business and, if well managed, will ensure that labor can bring about riches. Thus, it is heartily supported by the broad masses of peasants. Many examples can illustrate this point. Xingye Wooden Furniture Company of Chaochanghe village, Xiaozhan County, south suburb in Tianjin municipality is an example. The factory was founded in 1983 by 10 peasant households who jointly invested 14,000 yuan. Under competent leadership, the enterprise was very successfully operated. During the past 2 years, the fixed capital amounted to 260,000 yuan and it had relatively high productivity. Peasants' income was continuously raised, the annual income per peasant was about 1,700 yuan, and some people earned over 2,000 yuan per year. Leading cadres of the enterprise were given 300-500 yuan annually, in addition to the average wages, as an allowance for their extra duties. By doing so, a small number of rich people help a greater number of people to become rich.

Third, all types of joint capital enterprises provide a necessary way for the gradual realization of a cooperative economy.

Since the implementation of the system of contracted responsibility for production with remuneration linked to output in the rural areas, productivity has been further emancipated and peasants' enthusiasm in developing production has been mobilized. However, in the long run, small-scale production based on a single household is not in line with the further development of productivity. Therefore, the implementation of new joint capital associations is an inherent demand of the economic development in the rural areas.

The various types of joint capital enterprises in the rural areas in Tianjin municipality are, to a certain extent, different from the principle of cooperative economy in a general sense. This is because the levels of economic development in the rural areas of China are uneven. More importantly, the abilities, skills, and wages of individual peasants are greatly different. Therefore, it is inevitable that the various links, particularly the link of distribution, in joint capital enterprises, should allow some differences. At the present stage, all the different forms of joint capital enterprises are acceptable to people from different sectors and will play a positive role in promoting the development of productivity. Only when we join together in various different forms can we gradually lead the peasants to a better form of cooperative economy on the basis of developed production.

All the above points demonstrate that the emergence of peasants' joint capital enterprises conforms with the law of rural economic development. The promotion of this law will exert a far-reaching influence.

III. Probing Some Problems Regarding Rural Joint Capital Enterprises and Recommendations

Joint capital enterprises in the rural areas are still in their early stage of development and many problems are yet to be studied.

First, there are problems regarding the direction of production and operation of joint capital enterprises in the rural areas.

The problem of the direction of production and operation of joint capital enterprises in the rural areas refers to the problem of whether the processing of industrial products or the processing of local farm and sideline products and the development of natural resources should be taken as the key line of development. At present most joint capital enterprises in the rural areas are engaged in the production and processing of industrial and sideline products, and very few are engaged in processing farm and sideline products. We have investigated 25 joint capital enterprises in Linghe, Wuqing, Ji County and the south suburb, and only 4 of them were engaged in processing local farm and sideline products and exploiting local natural resources. Although such a situation is conducive to the transition of the rural production mix from unitarily agricultural to a diversified agricultural-industrial-commercial mix, a gradual transfer to processing farm and sideline products and exploiting and utilizing local natural resources should be an important direction for the operation of the joint capital enterprises in the rural areas. This is an important question regarding the development of the rural commodity economy in order to serve the plantation and breeding activities. We should proceed from reality and provide necessary guidance suited to local conditions. Suburban areas near the cities can operate more industrial processing, while counties and localities far from the cities should take processing farm and sideline products and exploiting and utilizing natural resources as the major work. This is for the long-term good. Of course, such guidance work should be planned and be carried out step by step and should not be conducted with coercion.

Second, there is the problem of the technical reform of joint capital enterprises in the rural areas.

Equipment used by the joint enterprises in the rural areas is old and technically backward, and most has been discarded by urban industrial enterprises through equipment renewal. They consume much energy and cause serious pollution, not only upsetting the ecological balance, but also harming the physical and mental health of the peasants. The present good economic effects of joint capital enterprises are attributable to the long work hours and intensive labor of the peasants. Therefore, questions including technical reform and antipollution with regard to joint capital enterprises deserve our full attention. We should deal with these questions consciously right now and should not wait until problems heap up. On the one hand, we should further remove the peasants' worries over expanded reproduction, and encourage them to invest and adopt new technology. The key here is to formulate some stipulations and policies. This will enable the peasants' joint capital enterprises to have a clear idea of what should be done and what should not be done. On the other hand, urban industrial enterprises should, in view of the well-being of the community, act strictly in accordance with the state's regulations on not spreading high energy consuming and environment polluting old equipment to rural areas. Industrial and commercial administration and supervision should be enforced and the central authorities' relevant regulations should be followed strictly. We should also adjust the policy on the purchases and sales of the means of production, open the market for the means of production, and enable the peasants' joint capital enterprises to buy the necessary means of production, just as the state-owned industrial enterprises can. We can permit eligible joint capital enterprises in the rural areas, assisted by the relevant departments, to trade with foreign merchants and purchase new technology. This will be beneficial to the technological reform of the joint capital enterprises in the rural areas.

Third, there is the problem of the proportion of share-dividends of joint capital enterprises in the rural areas.

In recent years, the State Council's relevant documents have repeatedly stipulated that the cooperative economy should exercise distribution according to work, or mainly according to work and supplemented by a certain proportion of share-dividends. They have also clearly stated that the annual after-tax profit of cooperative enterprises should be distributed under four categories: provident funds, community funds, labor bonuses and share-dividends. Share-dividends must not exceed 15 percent of the share-capital, while the appropriate distribution proportion of other items is determined through negotiations among the cooperating members. In practice, share-dividends of some joint capital enterprises far exceed the above regulations.

How should we see and deal with this question then? My opinion is that share-dividends are a kind of reward for investors and too much share-dividend does not tally with the socialist principle. But under the present situation where state ownership is predominant, this is not to be feared too much. If agreed by the peasants, a slightly higher proportion of share-dividend will not affect the whole situation. Under the present condition, it is advisable to arouse the peasants' initiative with regard to joint capital. In the long-term perspective, too much share-dividend will not be beneficial to the consolidation and development of the joint capital enterprises. Therefore, we should study this question. We should try to come up with a practicable proposal.

Fourth, there is the problem of the ownership of reserve funds of joint capital enterprises in the rural areas.

At present, many joint capital enterprises do not put aside reserve funds. We understand the reason is that some of them are afraid of changes in future policies. Another reason is the easy availability of credit and loans in the rural areas in an earlier period.

Although some enterprises have put aside reserve funds (some as high as around 30 percent), the reserve funds of many enterprises belong to the investors only, while the peasants who merely supply labor have no share in it. The state clearly stipulates: "All enterprises obeying the principle of individual willingness and mutual benefit among the laborers, accepting the state's planned guidance, practicing democratic management, drawing public reserves, collectively owning reserve funds, exercising distribution in accordance with work or mainly in accordance with work but with a certain proportion of share-dividend, will be regarded as socialist cooperative economy." ("Certain Regulations on the Present Rural Economic Policy," 2 January 1983) The January 1984 "Circular by the CPC Central Committee on Rural Work" also stipulates: "Among enterprises presently employing more laborers than stipulated, some have systems that differ from private enterprises. For example, they retain a certain proportion of reserve from the after-tax profit as a collectively owned asset, have regulations governing the limit of share dividend and owners' income and give the laborers a certain proportion of the profits as return for labor, etc. To a certain extent, they contain elements of the cooperative economy. We should assist them to continue their perfection and elevation. We can treat them not as capitalist employment business." Both of these documents regard the question of whether the joint capital enterprises are drawing reserve funds or not and the ownership of reserve funds as an important factor in determining whether they are private enterprises or cooperative enterprises and whether they use employed labor or mutual-aid labor. Hence, this question is very important with respect to both theory and practice. This should be an important factor to consider when formulating policies on the different varieties of joint capital enterprises.

I think this is a more important question that we should make an effort to solve at the present, as compared to the questions such as share-dividend and the high incomes of enterprise owners. We should abide with the central authorities' regulations and request the enterprises to draw reserves. We should stipulate that the reserve funds should be owned collectively by laborers as public asset and they should not belong to the investors personally. Otherwise, they will be treated as private enterprises. This demand is reasonable. The investors, besides enjoying higher wages and share-dividends, should not demand ownership of the reserves themselves. If we can strengthen our guidance and do a good job, the investors will readily accept this. Implementing this requirement will be beneficial to the development and consolidation of the enterprises. Other questions can be solved step by step in future when conditions are ripe.

The above questions are important economic questions. With the development of joint capital enterprises in the rural areas, more and more new situations and problems will arise. This requires that we investigate the real situations constantly in order to solve our problems as soon as possible.

PAPER NOTES IMPORTANCE OF TRADE, INDUSTRY INTEGRATION

HK020855 Beijing JINGJI GUANLI in Chinese No 4, 5 Apr 86 pp 7-11

[Article by Chang Fengchen [2490 7685 5256], edited by Lin Daojun [2651 6670 0689]: "Integration of Industry and Trade Is the Only Way for the Open Policy"]

[Text] To achieve integration of industry and trade is an important content of restructuring the economic system; this question is now being noticed and studied in the big municipalities throughout the country. In order to cope with the needs of the open policy and accelerate the speed of restructuring the economic system, Qingdao municipality began in 1982 to set up trial points to integrate industry and trade. It has established three integrated bodies of industry and trade--namely, the Qingdao Textile Joint Import and Export Company, the Qingdao Beverage Import and Export Company, and the Qingdao Rubber Products Import and Export Company--with over 70 member factories. In view of the actual situation, the procedure of integrating industry and trade is very difficult; there are numerous questions in the course of reform and there are several lessons to learn. However, both positive and negative experiences prove that integration of industry and trade is the only way for the open policy.

I. Integration of Industry and Trade Is an Important Prerequisite for Opening Up the International Market and Developing Our Country's Social Productivity

In the final analysis, the proposal of the principle of enlivening the domestic economy and adopting the open policy toward foreign countries is based on the nation's current standard of the development of the productive forces. Our objectives and tasks of adopting the open policy are to utilize both the domestic and international market to incessantly improve and develop the social productive force. Integration of industry and trade can effectively link these two markets and enable the enterprises to, by means of conducting economic activities with foreign countries, broaden their horizons, undergo training, and achieve improvement. The "Qingdao Textile Joint Company" allowed its member factories to participate in its business activities, whether they were talks with foreign enterprises or promotional trips abroad; it even allowed the member factories to send representatives to be stationed in the company and to participate directly in the company's various economic activities, thus enabling the production enterprises to gain better understanding of the international market. Practical experience has proved that the production enterprises' degree of understanding of the international market is closely related to the percentage of economic returns of foreign trade and export. In 1984 and when compared to the "Foreign Textile Company," the commodity circulation cost of the "Qingdao Textile Joint Company" was 1.49 percent lower and the foreign exchange production cost was 0.44 yuan lower. Since the Qingdao Beverage Import and Export Company carried out business activities with foreign countries, there were direct dealings between the enterprises and the customers, communication feedback was fast, sales volume was expanded, and its adaptability to the international market has been strengthened. Two years ago, some customers in the United States said that the packing of 2 dozen big bottles of beer was too heavy, affecting its sales in the U.S. market. The company then arranged for the production of 17,000 boxes each containing 1 dozen big bottles of beer last June, and the customers were very satisfied.

In order to cope with the various demands of the international market, we must quicken our pace in foreign economic activities. Integration of industry and trade reduces indirect links and effectively improves efficiency of work. For instance, there is a time limit for storage of beer and similar products; despite that Qingdao beer can be kept good for half a year under room temperature, the fresher the beer, the better the taste. The prolonged transportation period for export to Europe and the United States was a difficult question to resolve in the past. However, obvious improvements have been made since the Qingdao Beverage Company started to deal directly with foreign business and strengthened management.

The other objective of the open policy is to absorb advanced technology from abroad and incessantly improve the quality of enterprises and products. Integration of industry and trade can effectively give play to this role. Actual experience has proved that integration of industry and trade must always be accompanied by integration of technology and trade and that the latter can consolidate the development of the former. The two complement each other. The Qingdao Beverage Import and Export Company made use of integration of industry and trade to launch integration of technology and trade, the foreign merchants took the initiative to provide equipment for examination and analysis, solved the question of reducing air content in the bottle, increased the proportion of carbon dioxide, and resolved the questions that had remained pending for several years. The "Qingdao Textile Joint Company" has, by means of launching integration of industry and trade, assisted member factories to renovate 405 sets of corduroy spinning machines, renew 372 sets of cotton spinning machines, and repair an area of 4,000 square meters of storage space.

It is also possible to cultivate and train people in knowledge of production and foreign trade by means of integrating industry and trade. When industrialists have acquired knowledge on foreign trade business, they would also have knowledge of both production and foreign trade, and this is extremely beneficial to adopting the open policy. Integrated bodies of industry and trade have attached considerable importance to cultivation of talented people and have always selected and recommended management personnel from various departments such as business, financial accounting, manufacturing, transportation, and so on to attend training classes organized by the foreign trade departments or invited people from the foreign trade departments to give talks to these responsible persons. Thus, they were able to cultivate a batch of skeleton staff to handle foreign trade work in a relatively short time.

II. Integration of Industry and Trade Must Be Accompanied by a Complete Set of Reforms to the Current Economic System

Although integration of industry and trade is feasible generally speaking, it is practically inappropriate under the present circumstances in which the economic system has not been reformed in an overall way. Viewed from the angle of integration of industry and trade, many questions seem reasonable and feasible; however, we have always been disappointed due to certain restrictions in the current system. We are faced with a very practical problem: Integration of industry and trade cannot be carried out alone, but a complete set of reforms to the current economic system is needed. Only by so doing can we provide good external conditions for integration of industry and trade to adapt to and speed up the open policy.

A. As far as the foreign trade system is concerned, we should mainly include trial points of integration of industry and trade into the reform of the foreign trade system, giving them the same treatment as the foreign trade enterprises. The purpose of this is to compare the integrated bodies of industry and trade with the foreign trade enterprises, find out which system suits the actual situation of China, and further specify the direction for reform in the foreign trade system. We must promptly work out a solution to the several questions that follow:

1. The question of handing over foreign clients. Since liberation, our nation's foreign trade has basically been handled only by the foreign trade departments and numerous international clients have been secured. Since the establishment of the integrated bodies of industry and trade, the foreign trade departments should hand over to the subordinate member factories their original clients. If we do not resolve this question, activities of the integrated bodies of industry and trade will be restricted due to the question of market and will not be able to display their superiority.

2. The question of participation in trade with countries that abide by trade agreements. It is stipulated in Document No 5, 1985 issued by the State Council that trade talks with countries that abide by trade agreements conducted by the foreign trade subcompanies concerned, companies integrating industry and trade, and production enterprises are to be centrally organized by the General Import and Export Company. However, this question is not yet completely settled. Companies integrating industry and trade are joint enterprises that possess better production conditions; they are capable of shouldering export tasks to countries that abide by trade agreements. Moreover, the economic results are very good because large quantities of goods are produced, prices are high, and the proportion of intensive processing is large. We should give full play to this superiority in order to gain the faith of countries that abide by trade agreements.

3. The question of export quotas. Taking the "Qingdao textile joint system" as an example, its export volume has doubled since its establishment but the export quota allocated to it by the Ministry of Foreign Economic Relations and Trade remained the same as that of 1982. In 1985 in particular, China's textile export quotas to the United States were increased by a large percentage, but the "Qingdao textile joint system" was not even given a quota of an extra meter of cloth or an extra dozen knitted products. This has seriously affected the "Qingdao textile joint system" in its opening of markets abroad. In my opinion, the allocation of export quotas should be based on three conditions: First, the proportion of export and favorable condition of ports; second, export of superior quality goods and commodities that are able to open up markets should be encouraged; third, it is necessary to appropriately allocate quotas to enterprises integrating industry and trade and foreign trade enterprises and strive to give preferential treatment to the former.

4. The question of trademark. According to reflection made by the Qingdao Beverage Company, trademarks registered by the foreign trade departments overseas have not yet been handed over to the integrated bodies of industry and trade. As a result, the trademarks abroad are registered in accordance with the products of enterprises integrating industry and trade but they are indiscriminately used by enterprises that do not belong to the integrated bodies of industry and trade; the quality of products does not meet the standard, thus ruining the reputation of the brand in the international market. I think that the trademark is the reputation and should follow the product. Registration of an enterprise or product should only belong to that particular enterprise or product. We must not arbitrarily retain or transfer the registration in order to ensure the truthfulness and seriousness of the trade registration.

B. The crux of the financial system lies in resolving the question of disconnected channels and usage of capital. In accordance with information reflected by Qingdao's No 1 knitting factory, capital for manufacturing of export products is managed by the Bank of China while capital for the production process is managed by the Bank of Industry and Commerce, and this has seriously affected production. In my opinion, it is necessary to work out a scientific method of management for use of capital. First of all, it is necessary to promote a comprehensive balance and smash division of departments, and take the overall situation into account. Only transferring credits that have been deposited into the Bank of China to the Bank of Industry and Commerce does not mean reducing credits or increasing capital. Second, when we place orders from foreign countries, the foreign merchants only require the certificate of credit of the Bank of China to have the goods delivered and never demand payment in advance. When the Bank of China demands full payment of cash deposit in advance, it only implies that the foreign merchants trust the Bank of China but that the Bank of China does not trust the enterprises and the Bank of Industry and Commerce. We are only creating restrictions for ourselves by so doing. Third, payment is sometimes made prior to the delivery of goods. Although this increases the interest income of the banks, the production cost of the enterprises is also increased and the enterprises' returns are lowered. This financial management method is detrimental to integration of industry and trade and to the improvement of economic results.

C. As far as the financial system is concerned, we must mainly resolve the question of checking and ratifying the foreign exchange production cost and the question of overall financial accounting. The reasons are: First, since central finance and local finance have been separated, the local financial departments must take the risk of changes of the foreign exchange rate in the international market and instability of prices. All this affects local financial revenue and thus the local financial departments are reluctant to implement overall calculation of international price of exports. Second, the enterprises are unable to bear the drastic changes of the tax rate in the international market. Third, the checking and ratification of the foreign exchange production cost is very irrational. For the past several years, there have been great changes in the foreign exchange rate, but the contracted foreign exchange production cost has remained unchanged. As a result, the foreign exchange production cost ratified by the foreign trade enterprises tends to be relatively high and this is difficult for motivating the export initiative of enterprises integrating industry and trade. Fourth, the question of subsidies to differences of the foreign exchange production costs. Regarding the integrated bodies of industry and trade, due to the changes in the international markets and increasing prices of raw materials, we must not only appropriately readjust the foreign exchange production cost, but the central financial authorities should also give subsidies for the differences between the actual foreign exchange production cost and the ratified foreign exchange production cost caused by objective factors in the same way as they subsidize the foreign trade enterprises.

Before we carry out big reforms to the general financial system, we must support and give subsidies to enterprises integrating industry and trade. The specific implementation can be carried out in a planned way according to different situations. We can ratify the foreign exchange production cost of enterprises integrating industry and trade that are able to reach the standard and carry out appropriate readjustments in accordance with the changes of the international market. Regarding the enterprises integrating industry and trade that are unable to reach the ratified foreign exchange production cost, the difference between the actual foreign exchange production cost and the ratified foreign exchange production cost can be totally subsidized by the central financial authorities for the first 2 years, or allow the enterprises to contract for the planned amount of subsidy so that they can be solely responsible for the surplus or deficits; a planned amount of subsidy can be achieved for the following 3 years which is to be shared by the local and central financial authorities in the ratio of four to six; the enterprises should be able to take up sole responsibility for their own profits and losses from the next 5 years onward and should be able to accommodate the differences. This method of gradual transition enables the enterprises integrating industry and trade to gain development because of actual but not verbal support.

D. The price system must also carry out reforms accordingly. The basic trend of reform is that the domestic prices get closer to the international prices and that the two prices can be hooked up in order to reduce state subsidies, improve export results, and create better conditions for enterprises integrating industry and trade to be responsible for their own profits and losses. The specific method of hooking up domestic and international prices is that prices of export products to the international market are to be fixed in accordance with the prices of the international market; prices of products that are both sold in the domestic market and exported to foreign markets are to be fixed in renminbi in accordance with the export price; prices of imported products sold in the domestic market are to be fixed in renminbi in accordance with the exchange rate for imports plus tariff; prices of similar domestic products are to be fixed in accordance with such prices. We should gradually reduce the price difference between the domestic and international markets by means of reforms in order to create conditions for enterprises integrating industry and trade to achieve overall calculation of international prices of imports and exports.

III. It Is Necessary To Proceed From the Actual Situation To Achieve Integration of Industry and Trade and Choose Multiple Forms

Integration of industry and trade includes both integration of technology and trade and integration of import and export. It is hard to find an ideal unified form; we must proceed from the actual situation of various cities and implement multiple forms with different characteristics.

1. We may implement both close integration and loose integration. Close integration means that several member factories can form an economic body and carry out unified accounting and this may exist as a first class legal body. Loose integration means that the enterprises carry out partial integration to deal with foreign business in accordance with export needs. Any form of integration, whether close or loose, should implement the principle of voluntary participation and must never implement forced matching or combined administration. At present, the three integrated bodies of industry and trade established in Qingdao city belong to the type of close integration but are basically joint in accordance with administrative measures. If possible in future, it is necessary to carry out reintegration in accordance with the above principle and the actual situation. We must on the one hand allow enterprises to join integrated systems of industry and trade of the related business and on the other hand allow them to join other integrated systems and carry out direct export in the foreign trade departments or in other ports.

2. We may implement both integration of industry and trade with the main emphasis on industry and integration of industry and trade with the main emphasis on foreign trade. Integration of industry and trade with the main emphasis on industry mainly means that the industrial departments run foreign trade business as well and their products are mainly for the domestic market, with only a small portion for export; domestic products are accorded a higher priority than export products and the domestic market is to be speeded up by exports. Integration of industry and trade with the main emphasis on foreign trade means that the foreign trade enterprises run industries and produce export products in accordance with the demands of the international market.

This kind of integration of industry and trade enhances the products' adaptability and flexibility in the international market.

3. We may implement integration of industry and trade both in the form of agent and in the form of partnership business. The agent system is a relatively common form of integrating industry and trade--the foreign trade enterprises are entrusted by industrial enterprises to carry out foreign trade and the industrial enterprises are responsible for the expenses incurred; the task of the foreign trade enterprises is to sign contracts with the foreign merchants and act as a medium, not bearing any liabilities. The system of partnership business is another common form of integration of industry and trade--the foreign trade enterprises and the industrial enterprises join as partners to do business; they share the same liabilities and interests. As far as the extent of cooperation is concerned, some are limited to marketing, while others are involved both in production and marketing of products.

4. We must allow industrial enterprises to directly enter the international market. However, we must exercise strict control at present on this kind of integration of industry and trade. In order to deal with direct export, the production enterprises must possess the following conditions: 1) The production enterprises occupy an important position in export business, their production output of export products should account for at least 20 percent of the total production output, and over 50 percent of raw materials and means of production should be imported from abroad; 2) they should undertake the state's mandatory export foreign exchange tasks; 3) they should possess the establishment, capital, and cadres for launching foreign trade business. The number of enterprises possessing these conditions will be on the increase among the various big cities throughout our country, and this kind of integration of industry and trade will definitely gain great development.

IV. Integration of Industry and Trade Must Be Based on Increasing the Activities of the Enterprises

The mere initiative of the foreign trade departments is insufficient for promoting the open policy and developing foreign trade business; it is more important that we give play to and motivate the initiative of the production enterprises, change the factories' passive attitude of being unconcerned and aloof to foreign trade, and turn the factories into progressive bases of the open policy.

1. It is necessary to adopt positive measures to link foreign exchange output with interests of the enterprises. At present, we should adopt the following encouraging policies and methods: 1) It is necessary to accordingly readjust and increase the enterprises' proportion of foreign exchange in accordance with the situation of the fulfillment of the foreign exchange output plan. The state now stipulates that only 25 percent of foreign exchange is to be shared in the ratio of 1 to 1 between the province and the cities, which is then shared in the ratio of 4 to 6 between the city and the trades, and again equally shared between the trade and the enterprises. As a result, the

enterprises can only be given a proportion of 3.75 percent of foreign exchange. This method of foreign exchange division deprives the enterprises integrating industry and trade of the capacity of paying foreign exchange for imported raw materials. Thus, we suggest that in future when the state assigns mandatory foreign exchange output plans to the export enterprises, it should increase the proportion of foreign exchange in enterprises that can satisfactorily fulfill the plan, the enterprises should be given 25 percent or even more. 2) It is necessary to rationally share the profits among the members of the integrated bodies of industry and trade. When the enterprises gain profits, the integrated bodies of industry and trade will be able to generate a higher centripetal force. 3) We suggest that the state establish an honorary list of export enterprises and an encouragement fund for foreign exchange output, giving both spiritual and material encouragement for the enterprises to produce more export products and earn more foreign exchange income. 4) As far as enterprises that earn more foreign exchange income each year but of which the achieved profits are reduced by a large percentage are concerned, it is recommended that the central financial authorities withdraw their accounts and that the provincial and municipal authorities give appropriate subsidies to resolve the question of reduced retention of profits in the enterprises. The specific measure is to maintain the basic standard of retention of profits ratified in the second stage of replacing profits submission with taxation.

2. It is necessary to incessantly improve internal management and implement a strict and scientific method of checking and ratification. We must gradually establish the following systems of management inside the integrated bodies of industry and trade: First, a rational accounting system. The form and system of accounting inside the integrated bodies must never be rigid, and we should use various methods that suit the actual situation in order to promote the internal situation of the integrated bodies. Second, we must establish a system of regular analysis of stored products. On the basis of regular analysis and clear responsibilities, the bank can assess the proportion of capital used for the products and supply capital in a planned way, in accordance with the actual needs for production and the production of exports. The enterprises should be charged extra interest for capital used beyond budget and should be imposed credit sanctions for blind production. Third, we must establish a scientific examination system. We must not take the foreign exchange production cost as the sole criterion for assessing the situation of integration of industry and trade, but must examine various comprehensive standards. We must attach primary importance to making foreign exchange income which indicates the overall interest of the state; second, we must examine the quality of products and the rate of fulfilling contracts to ensure the life and reputation of the products; we must also examine the foreign exchange production cost and the achieved profits. This can enable the enterprises integrating industry and trade to improve economic returns in an overall way.

3. It is necessary to improve the quality of the enterprises and tap the internal potentials of the enterprises. In view of the competition of the international market and the situation of the open policy, the quality of the enterprises integrating industry and trade face the following challenges:

1) Feedback must be accurate, sensitive and fast. 2) It is necessary to make more efforts on establishment of the staff force. Apart from cultivation of staff in actual work, we should also transfer and recruit certain skeleton workers from the foreign trade departments who have production and foreign trade knowledge in order to cope with the needs of the open policy. 3) It is necessary to promote intensive processing of products.

The CPC Central Committee's proposal on the Seventh 5-Year Plan pointed out that we should accord first priority to reforms. We believe that the path of reform of integration of industry and trade will definitely become broader and will play its role in the work of opening up to foreign countries.

ECONOMIC MANAGEMENT

ISSUES IN PRICE REFORM DISCUSSED BY INSTITUTE DIRECTOR

Shanghai SHANGHAI JINGJI [SHANGHAI ECONOMY] in Chinese No 3, 15 Jun 85 p 5

[Article by Xu Zhihe [1776 0037 3109], director of the Institute of Departmental Economics of the Shanghai Academy of Social Sciences: "Critical Issues Concerning Price Reform"]

[Text] Since the 3d Plenary Session of the 11th CPC Central Committee, the state has already carried out some adjustments and initial reforms on prices. This has played a considerable role in the development of the national economy. However, the current price system is still irrational. Not only does it obstruct the improvement of economic results, but it also is unfavourable to the reform of the economic system and the implementation of the policy of opening to the outside world. It is extremely unfavorable to developing the national economy in a harmonious fashion and to meeting the needs of people's livelihood. The time has come when we must carry out reform in order to advance. At present, we have decided to basically handle the price system properly within 5 years. Since 1985 is the first year of the reform of price system, taking into consideration the financial capability of the state, the absorption capability of the enterprise and the endurance of the masses, the State Council has decided to adopt the policy of combining relaxation with adjustment and taking small steps forward. Meanwhile, it is necessary to proceed from reality and implement the principle of "upgrading and downgrading" in an effort to stabilize commodity prices as a whole. In his report on the work of the government at the Third Session of the Sixth National People's Congress, Premier Zhao put forward four main issues and five measures of guarantee for the price reform in 1985. Currently, the various localities are conscientiously implementing the above. In order to take the important step forward properly in the price reform, I feel that we must also attach importance to the following issues.

I. After implementing fixed procurement by contract of grain and cotton and relaxing the price control over other agricultural sideline products, we should offer guidance to the peasants. The rural areas are not properly informed about the domestic and foreign markets. The peasants must gradually adapt to market production. Without guidance, blindness may appear in the restructuring of the agricultural production structure, which will result in economic losses. In the grain and cotton producing areas, the state monopoly of purchase and sales is replaced by preferential prices and protective prices according to contract. This may lead the problem of reduction of the peasants' income, which may affect the enthusiasm of the peasants. The increase in the non-staple food prices may lead to the increase in relevant prices, resulting in indiscriminate price increases which may affect the people's livelihood. We must anticipate these circumstances and adopt some measures in advance to avoid them as best we can.

II. With the increase in short-distance rail transport charges, the demand for water and highway transport will increase. Currently, the highway conditions are still poor, with a shortage of motor vehicles to meet the demand. Importation of motor vehicles is necessary. The water transport facilities are obsolete and underdeveloped. Transformation and improvement are necessary. These situations will increase the burdens of state investment and foreign exchange. We must pay attention to and try our best to solve these problems.

III. The reform of the price system is the key to the reform of the overall economic system. We should handle properly the various relationships correspondingly. We must conduct thorough investigations and study, and strive to gradually set up a price system that is based on both values and the relationship between supply and demand. The price administration departments must control prices by observing the objective economic laws, and not by relying excessively on administrative decrees. We must truly allow commodity prices to go up and down and strive for a stability in the overall level of commodity prices. In particular, we must handle properly the relationship between the price reform and the wage reform. If commodity prices increase before wages increase, and commodity prices increase again after wage increases, followed by another wage increase, a vicious cycle will be formed, which will be difficult to cope with. We must coordinate the price index with the wage index and let the rate of growth of commodity prices fall behind the rate of growth of wages in order to ensure the continuous improvement of the people's standard of living.

IV. We must adopt some specific measures to strengthen price control. In addition to formulating relevant policies and laws of price control, we must also formulate detailed regulations on implementation in order to make the laws effective. The various enterprises must assign specific individuals to be in charge of price control and to guarantee the implementation of the state price policies. We must set up a system of clearly marked prices easy for supervision and inspection by the masses. We must set up a price suggestion box to gather information on acts of indiscriminate price inflation without delay and to investigate and handle these acts strictly. We must persevere in carrying out price supervision and inspection properly, and mete out rewards or penalties accordingly. We must find several typical cases of indiscriminate price inflation and deal heavy blows to them in order to educate the cadres and masses.

FINANCE AND BANKING

PREREQUISITES FOR SHANGHAI TO BE FINANCIAL CENTER DISCUSSED

Shanghai SHIJIE JINGJI DAOBAO [WORLD ECONOMIC HERALD] in Chinese 23 Sep 85 p 9

[Text] "Appropriately adding financial institutions is a key prerequisite for Shanghai to become a financial center and a necessary step to break the monopoly of credit business. It is also an important link for invigorating finance and utilizing funds well." The above is unanimously indicated by the personages of the Shanghai's financial circle in an interview with our reporters.

The specialists told the reporters that the central authorities had pointed out before that "we should establish a socialist financial system with the central bank as the center and the specialized banks as the main bodies and with the coexistence of diverse financial institutions." As we all know, the financial system is consituted by not a few but many financial institutions. As the most developed region of productive forces in the country, Shanghai not only should try by each and every means to raise more funds, but more importantly should effectively utilize the funds and flexibly allocate these funds. Therefore, for a future period, Shanghai should consider setting up various new financial institutions.

First, we should consider letting the former joint state-private banks of the Chinese banking groups in Hong Kong to set up branches in Shanghai. Currently, there are 13 Chinese bank groups in Hong Kong. Of these, some former joint state-private banks had established historical relationships with Shanghai and had established main offices in Shanghai before the "Cultural Revolution." They are the Xinhua, Jincheng, Zhejiang Xingye, Zhongnan, Guohua and Yanye banks. These banks have moved their main offices to Beijing in 1980. Their business in Hong Kong is especially flourishing. These banks all have more than 10 branches in Hong Kong. Some even have 20 branches. These banks have good credit and considerably large amounts of deposits. After being listed as an open city, Shanghai has become quite attractive to these banks, several of which have expressed the willingness to set up branches in Shanghai.

The specialists maintained that if we allow these banks to set up branches in Shanghai, we can utilize their current financial network and customer relations and the wide contacts with various large banks in the world to set up another channel for importing foreign capital and facilitating the expansion of the foreign trade export business, as well as obtain overseas financial information without delay and invigorate the Shanghai financial market.

Second, the specialist proposed that we should allow foreign banks to set up branches in Shanghai for business. Among the 17 foreign banking agencies in Shanghai, some have already expressed the wish of do business in Shanghai. We should consider allowing a group of reputable banks in Japan, the United States, France, Italy, West Germany and other countries, which have had more contacts with us, to set up branches for business. The specialists pointed out that the entry of foreign banks will indeed cause some problems in administration and in business competition for the Chinese banks. However, letting more foreign banks do business in Shanghai has its positive impact. We can conveniently raise foreign funds nearby as well as bring in foreign investment through these banks. We can conveniently import and digest the advanced operational technology of the banks of various countries in the world. We can also, through practice, train our own qualified personnel in international financial business and foreign exchange management.

Third, we can consider setting up a national comprehensive bank in Shanghai. This has actually been approved by the central authorities. Our present problem is that, although we have begun our preparations, we are making slow headway. We must adopt more effective measures and change the ways and means of preparation to speed up project.

Fourth, some personages of the financial circle also maintained that Shanghai may set up a Shanghai City Bank or City Construction Bank. Its main duties are to absorb the idle capital in the city, to act as a collecting agent of local financial taxes, to issue local urban construction bonds, and to support the development of the local economy.

The specialists further indicated that, in light of the new economic situation, we should also further broaden the train of thought and untie ours own hands and feet. Currently, the collective economy and individual economy are developing rapidly and are playing more and more important roles in the realms of production and circulation. The urban collective credit business should organize itself accordingly. We must set up "people-run" and not "official-run" urban credit cooperatives. Then, on the basis of having established several cooperatives, we should set up city-linked cooperatives, which will ultimately become the major force in the fund transaction between urban collective enterprises and the individual households.

In addition, to further invigorate the financial situation, we should consider setting up some non-bank financial institutions. These institutions include insurance companies, financial affairs companies, leasing companies, trust companies, investment companies and others. These financial intermediary institutions may be run by ministries, cities, or fraternal provincies. They may also be collective operations, joint operations, joint ventures or investments by Hong Kong businessmen. The establishment of these intermediary institutions will help raise the funds needed for local constructions and will also help attract foreign capital and invigorate the financial situation. These institutions should be put under financial administration by the People's Bank. The specialists maintained that, currently we can stress the development of local, business and professional insurance companies and set up an old-age pension system. This will gradually distribute evenly the enterprises' burdens, safeguard the old-age livelihood of the staff members and workers, and accumulate huge funds for the state.

Lastly, these specialists, who are proficient in financial matters, pointed out that we must clarify the misunderstanding by some people, who always feel that more financial institutions will easily result in confusion and hinder the implementation of macroeconomic control. Bringing into play the roles of various types of financial organizations is an important link in the reform of the economic system, especially the financial system, and is a necessity for the four modernizations. It does not prevent the central banks from controlling the macroeconomy. The specialists indicated that the unified and centralized nature of financial work is quite strong. The formulation and implementation of the reform program for the entire financial system should be put under the unified consideration and planning of the state. However, Shanghai should take the lead in the reform of the financial system in light of the necessary limits of authority conferred upon it by the State Council as well as the spirit of the special policy relevant to it.

QUESTION OF INFLATION DUE TO PRICE REFORM DISCUSSED

Beijing GONGREN RIBAO in Chinese 18 Nov 85 p 2

[Article by Wang Shimin [3769 0013 3046] of the Staff Ideological and Political Work Study Committee of the Propaganda Department of the Party Committee of the Shanghai Steam Turbine Factory: "Will the Reform of the Price System Result in Waves of Price Inflation?"]

[Text] Following the price increase of some commodities in the 4th quarter of last year, the prices of some commodities have increased again this year. Some of our comrades are worried that the reform of the price system may result in waves of price inflation. The emergence of this feeling is due to the following: First, some comrades have suffered from price inflation in waves in the old society. Second, in the 4th quarter last year, due to the lack of strict control over credit funds and consumer funds, the banks issued too much currency, which affected prices and brought about fear in people's hearts. The emergence of these worries is natural but unnecessary. This is because our reform of the price system is instituted under leadership and in a planned manner step by step under the socialist system and cannot possibly result in waves of inflation. The following are the reasons:

I. The reform of the price system and the widespread price inflation in waves are two essentially different matters. Before liberation, the widespread price inflation in waves in our country resulted from the corruption and improper system of the reactionary government, the undermining of production, the shortage of materials and the indiscriminate issuance of currency. However, our current reform of the price system is carried out under the terms of the development of production and the daily-increasing abundance of materials. The reform of the price system is a structural readjustment with the goal to handle properly the relationships by adjusting upward the prices of those commodities, the values of which are higher than the prices and the demand of which is higher than the supply, and by adjusting downward those commodities, the values of which are lower than the prices and the supply of which is higher than the demand. Thus, prices do move up and down and will not result in inflation in waves.

II. On the road of our reform of the price system, some temporary problems have arisen, but we have fundamentally implemented the following measures: 1) Strictly controlling the issuance of currency; 2) controlling the issuance of credits; 3) controlling the investment in fixed assets; and 4) resuming the administration of wage funds this year. It has generally restrained the price inflation in waves.

III. The state is fully capable of withdrawing currency from circulation. Some of our comrades have heard that the state has issued more currency last year. They are somewhat alarmed and are worried that prices will go up when the amount of currency in circulation exceeds the real demand. Though we must not treat this problem lightly, we must not be panic-stricken. We should believe in the state's full capability to withdraw currency from circulation. In the early post-liberation period from 1949 to February 1950, the country experienced financial difficulties. The currency issued increased from 1.85 million yuan in 1948 to 300 million yuan in a short time, an increase of over 160 times. We remember that at that time one dan of rice, priced at 50,000 yuan in the daytime, went up to over 60,000 yuan in the evening. In spite of the severely difficult sitaution at that time, we still overcame our difficulty by implementing the following two measures: One was to sell "two whites, one black" (namely rice, cloth and coal) in large quantities, which controlled the prices of the basic consumer goods. Another was to issue the first construction bonds which totalled 120 million yuan. In the early 1960's, the country experienced great financial difficulties. An excess of 7.28 billion yuan was issued. At that time, the state carried out the following three measures. First, for 18 items of daily necessities (later increased to over 90), we adopted the measure of supply with voucher. Second, through selling pastries and candies at high prices and offering high-price dishes in restaurants, we recovered 1 billion yuan of currency. Third, the state controlled the amount of currency issued. The problems were eventually solved. Thus, although more currency was issued last year, it was only a problem in the midst of progress. Currently, it is not as difficult as in the past to withdraw the currency which has been issued in excess, and it is therefore unnecessary to adopt the previous measures.

At present, we have generally adopted the following nine measures to withdraw currency from circulation: 1) Producing more marketable high-quality and name-brand products; 2) vigorously developing the tertiary industries, especially developing non-commodity industries (such as the advertising business); 3) selling some marketable residential housing; 4) issuing more state treasury bonds; 5) selling small state-owned enterprises (this was originally a tentative plan in the economic reform); 6) properly enhancing the interest rate of savings deposits to encourage people to increase their savings; 7) reducing the group purchasing power by 10 to 20 percent less than before (restricting the purchases of high-grade consumer goods with public funds); 8) importing and selling some needed foreign high-grade commodities; and 9) supplying some gold for making jewelry to sell.

IV. The state can stabilize prices through state-owned commerce. In our country's economy, the system of ownership by all people is the main body, the collective is the assistant, and the individual is the supplement. The main economic lifelines are stably controlled by the state. The state has great strength. In 1984, the grain yield was 407 million tons, cotton yield was 6.077 million tons, and edible oil yield was 11.852 million tons. The country's abundant materials can be a powerful backing. The state-owned commerce can fully play a powerful role in stabilizing prices. When prices were relaxed in a general scale in Guangzhou City, some prices went up by a margin in the beginning. But they were lowered afterwards. What were the reasons? On the one hand, the economic levers played their roles. For example, black carp, crucian carp and bream were priced at over 3 yuan per jin in the beginning. With an increase in production in the last 2 years, their prices have stabilized at around 1.5 yuan per jin. On the other hand the state is the backing. When the prices go up too much, large quantities of goods and materials are transferred from inland, which bring the prices down.

V. The State can also utilize economic, administrative and legal measures to strengthen control. For example, a shop in Shanghai buys ham at parity and sells it at a negotiated price. The ill-gotten gains, which infringed upon the interests of the consumer, have been confiscated, and the shop was imposed a fine. The manager was also discharged from his post.

VI. To solve the inversion of purchase and sale of agricultural sideline products, the implied subsidy is changed into obvious subsidy. That is, the state allows the increase in the sales prices of agricultural sideline products, and subsidizes the consumers with the money which was formerly used to subsidize the peasants. Some people are worried that this will cause a chain reaction of price inflation. In fact, this is merely a change in the form of subsidy which does not involve the increase of currency in society. Thus, it will not cause a price inflation in waves when the amount of currency in circulation exceeds the real demand.

FINANCE AND BANKING

INSURANCE INDUSTRY DEVELOPMENTS REPORTED

Hong Kong JINGJI DAOBAO [ECONOMY REPORTER] in Chinese 1 Jan 86 pp 68-69

[Report by Special Correspondent: "New Progress in China's Insurance Business; an Interview with Qin Daofu, General Manager of the China People's Insurance Company"]

[Text] After China's insurance business has achieved good results continuously for 5 years, the insurance premium earnings have again increased by a relatively wide margin in the first half of last year. From January to June, the various insurance premium earnings of the China's People's Insurance Company totaled nearly 1.5 billion yuan, an increase of over 60 percent compared with the same period of the year before last. Of these, the domestic insurance premium earnings totaled over 1.1 billon yuan, an increase of about 82 percent compared with the same period of the year before last; the overseas insurance premium earnings totaled about $120 million, an increase of about 33 percent compared with the same period of the year before last.

Recently, a reporter had an interview with Mr. Qin Daofu [4440 6670 1133], general manager of the China People's Insurance Company, who graciously replied to the questions posed by the reporter.

New Life in the Midst of Relaxation and Reform

General manager Qin Daofu said that the Chinese insurance business has become increasingly more vigorous in recent years. Up to the end of 1984, with the exception of Xizang and Taiwan, the China People's Insurance Company has established 2,100 branches in the nation's 28 provinces, autonomous regions and municipalities, with over 36,000 employees. In 1980, the total insurance premium earnings were 470 million yuan (including overseas business). In 1984, it increased to 1.98 billion yuan, an increase of 3.3 times with the annual growth rate of 44.68 percent.

He said: However, the development of the Chinese insurance business was not smooth sailing. It has traversed a tortuous road of development.

General manager Qin recalled that the Chinese national insurance business began in 1885. Today, it has enjoyed a history of exactly 100 years. Before liberation, the insurance business developed slowly because it suffered from longstanding suppression, exclusion and blows by foreign capital. At that time, there were few national insurance companies, and the domestic insurance market was monopolized by foreign capital. Also, the companies were concentrated only in the several large coastal cities, such as Guangzhou and Shanghai.

In October 1949, the China People's Insurance Company was established. By the end of the 1950s, there were over 4,600 Chinese insurance organizations, employing over 50,000 staff and workers. However, after 1959, the Chinese insurance business was obstructed. With the exception of the overseas insurance business, which continued to operate, the domestic insurance business was closed down entirely. The situation continued to the end of 1979.

Since the end of 1979, with the implementation of the policy of opening to the outside world and revitalizing the economy domestically, China's insurance business has embarked on a healthy road of development. The business of the various branches of the China People's Insurance Company are expanding continuously. A new flourishing situation has appeared. By 1984, the insurance company has set up over 120 varieties of domestic insurance business, with a total of over 1.5 billion yuan in insurance premium earnings. That year, the insured enterprises totalled nearly 340,000, the insured households totalled 13.84 million, the insured motor vehicles totaled nearly 2 million, and the various life insurance participants totaled 2.876 million. The various provinces, autonomous regions and municipalities (all but Xizang and Taiwan) throughout the country have overfulfilled their year's plans.

The Abrupt Rise of Rural Insurance Business

General manager Qin said: Since the reform of the rural economic system, the insurance companies have handled the rural insurance business in order to develop rural commodity production and support the peasants in scientific farming. At present there are over 40 insurance items, including rural property, motor vehicles, freight transport, ships, fishing boats, animal-drawn carts, and the planting undertaking, breeding trade and others. By the end of 1984, the Chinese rural insurance values amounted to 95.7 billion yuan and the insurance premium earnings totaled more than 330 million yuan, showing respective increases of nearly 2.5 times and 2.6 times over the preceding year.

In light of rural reality, the insurance companies of various provinces and municipalities have handled many new insurance items since last year. For example, the insurance companies of Liaoning, Shanghai, Jiangsu, Hubei, Guangdong, Jiangxi and other places have tried out the fish-breeding insurance. The Yangxin County Insurance Company in Hubei Province has tried out insurance freshwater pearl cultivation. The Qingdao City Insurance Company in Shandong Province is trying out the cost insurance for kelp cultivation. This is welcomed by the local specialized households in aquatic product breeding. In the year before last, Jilin and Heilongjiang obtained an agricultural bumper harvest. The two provinces successively attempted to set up an insurance business in grain storage by peasants for the state in order to remedy the shortage of the state's inadequate grain storage capacity. Nearly 300,000 peasant households have taken out insurance, which totalled more than 1.6 billion jin of insured grain.

Qin said: Currently, the proportion of rural insurance premium earnings in the total domestic insurance premium earnings have increased from 12 percent in 1983 to 22 percent. This situation indicates that the structure of China's domestic insurance business is gradually moving from development of the urban business primarily and the rural business secondarily to simultaneous development of both the urban and rural businesses.

Rapid Development of Property Insurance

Qin told the reporter that the domestic property insurance business has developed significantly with the continuous development of China's national economy and the daily-improving standard of living of the people. With the deepening of the reform of the economic system, more and more state-owned enterprises, collective enterprises, rural and township enterprises and individual businessmen have taken out insurance. Particularly worth mentioning is the fact that after the state-owned enterprises have implemented management on their own and assumed sole responsibility for their profits and losses, participating in insurance plans has become a necessary business measure in assuming responsibility for the safety of the state's properties. Statistics show that the insurance premium earnings of domestic enterprise property insurance totalled 450 million yuan, a 20.5 percent increase over the same period of the year before last. By the end of June last year, over 196,900 state-owned, collective and individual enterprises in China have participated in property insurance plans, over 73,7000 were state-owned enterprises and over 41,700 were collective enterprises. These were the largest figures since Liberation.

Qin revealed that, in respect to insurance premium earnings, motor vehicle insurance has become the second biggest insurance item in domestic business in China in recent years. In the countryside the implementation of this business has provided economic insurance for losses resulting from accidents occurring during transport. It is greatly welcomed by the masses of specialized transport households.

General manager Qin said: In recent years, China's family property insurance and life insurance businesses have developed further. In the first half of last year, the insurance premium earnings of individual family properties totaled 30 million yuan, a 169.8 percent increase over the same period of the year before last, the insured urban and rural families totaled 11.76 million. The worker's pension insurance and simple life insurance of urban and rural collective enterprises, which are offered widely by various insurance companies, have increased. Some branches have also opened many other insurance policies, such as group life insurance, group personal accident insurance, additional medical insurance, highway-passenger accident insurance, ship-passenger accident insurance, air-passenger accident insurance, tourist accident insurance, personal pension insurance, personal medical insurance, recreation accident insurance, and so on. In the first half of last year the insurance premium earnings of life insurance totalled 133 million yuan, basically fulfilling the whole year's plan. Five million people have participated in different life insurance policies.

In 1984, in the various domestic businesses, the China People's Insurance Company handled over 420,000 cases of compensation involving a total of 650 million yuan and a compensatory rate of 43 percent. In the first half of last year, 350 million yuan in compensation was paid, showing a wide-margin growth over the corresponding period of the preceding year. Qin said: Through insurance compensation, we have stabilized the production and management of enterprises, have settled the people's livelihood, and have lightened the burdens of the financial and social welfare departments.

Increase in Overseas Insurance Items

In respect to the development of China's overseas insurance business, general manager Qin expressed optimism. He told the reporter that the China People's Insurance Company has set up an overseas insurance business in order to vigorously serve the policy of opening to the outside world. With the implementation of the policy of opening to the outside world, the overseas insurance business has developed further. The overseas insurance business has developed from simple import-export freight transport insurance in the early days after Liberation to more than 40 insurance items, including Sino-foreign joint venture insurance, imported materials processing insurance, compensatory trade insurance, construction project insurance, ship construction insurance, oil exploitation insurance, labor-service export insurance, public responsibility insurance, business discontinuation insurance, political risk insurance, nuclear power plant insurance, communications sanitation insurance and others. The China People's Insurance Company can handle all the insurance businesses which the international insurance market can handle. These overseas insurance businesses have adapted to the various demands of the overseas customers and have provided the necessary insurance for the latter. In particular, in light of the depression in the world insurance market and the increase in the trend of deficit of the reinsurance business, in the China People's Insurance Company has promoted its business relationship with the counterparts of other countries and has introduced and saved foreign exchange capital through handling reinsurance business.

In respect to the relationship with its international counterparts, general manager Qin said that, currently the China People's Insurance Company has set up a business relationship of insurance-sharing with nearly 1,000 counterparts of over 120 countries and regions in the world. In 1980, the China People's Insurance Company set up a liaison office in London to strengthen the relationship with its counterparts from other countries. The China People's Insurance Company and the London Branch of the Bank of China jointly set up the China Insurance Company (UK) in London. In 1981, the China People's Insurance Company and the U.S. International Insurance Group jointly set up the China-U.S. Insurance Company in Bermuda, with branaches in New York and Hong Kong. In recent years, the China People's Insurance Company also participated in the Asian Reinsurance Company, which was sponsored by the the Consular Conference of the United Nations and the Economic and Social Council of the Asia Pacific regions; and joined the Southland Insurance Group of the New York Insurance Exchange of the United States. A total of 10 foreign insurance companies have set up agencies in Beijing.

In introducing the situation of compensation in the overseas insurance business of the China People's Insurance Company, general manager Qin said that the China People's Insurance Company all along embraces the spirit of complying with the agreement and keeping one's promise in handling overseas insurance compensation cases. The compensation is always paid quickly. A total of $36.7 million involving various compensation (excluding the reinsurance business) was paid in 1984, as well as $15 million in the first half of last year. In handling compensation cases, the China People's Insurance Company conscientiously clarifies responsibilities. If the carrier is responsible, compensation is recovered from the responsible party by means of various channels and in accordance with the relevant laws. Last year, Guangdong Province handled over 500 compensation-recovery cases of import-export freight transport insurance, involving nearly $400,000. It has effectively supported China's foreign economic trade activities.

Lastly, general manager Qin said: The China People's Insurance Company will further perfect its organization, strengthen its management and improve its service quality. He said: We will adopt more flexible measures to meet our customer's demands and make an effort to open new businesses in order to develop the overseas insurance business by an even wider margin.

WUHAN STEEL CORPORATION PROFIT TAXES REPORTED

Wuhan HUBEI RIBAO in Chinese 13 Nov 85 p 1

[Report by correspondent Zhang Dongsheng [1728 2639 3932] and reporter He Jinkai [0149 6855 7030]: "Wuhan Steel Realizes 3.967 Billion Yuan Profit Tax during 6th 5-Year Plan"]

[Text] On 4 November at the public lecture on revitalizing large enterprises held by the State Economic Commission, Huang Mobin [7806 1075 3453], Manager of the Wuhan Iron and Steel Corporation, said that the corporation has realized 3.967 billion yuan of profit taxes during the "Sixth 5-Year Plan" period, equivalent to 125.64 percent of the total profit taxes of the 23 years from 1958 when the corporation went into operation to 1980.

The basic approaches of the corporation to improve economic results are:

I. Increasing output. Due to the increase in output, the surplus product taxes and profits totaled 1.8 billion yuan in 5 years.

II. Improving quality. This year the comprehensive approval rate of steel products has reached 99.21 percent, 1.55 percent higher than 1981. In the last 3 years, the output of steel and steel products has respectively increased 1.2 million tons, but the total reject rate of steel-smelting and steel-rolling has corresponding decreased by 0.255 million tons. The rate of outstanding quality products has improved from 6.05 percent in 1980 to 55 percent this year. The comprehensive finished-product passing rate from steel ingot to steel products has improved at an annual rate of 1.6 percent from 1982 to this year.

III. Changing the product structure. Because of the importation of advanced technology, a 1.7 meter steel rolling system has been built, resulting in a major change in the product structure of the Wuhan Iron and Steel Corporation. The profits of the products of the 1.7 meter system constitute over 80 percent of the gross profits of the corporation.

IV. Lowering consumption. During the "Sixth 5-Year Plan" period, the Wuhan Iron and Steel Corporation has offset the factor of price inflation by nearly 640 million yuan. One remarkable attempt has been through saving energy and lowering consumption. The consumption by an output value per 10,000 tons (converted into standard coal) has been reduced from 20.81 tons in 1983 to 16.87 tons this year. The comprehensive energy consumption per ton of steel has been reduced from 1,439 kg in 1983 to 1,243 kg this year.

Huang Mobin further said that these approaches to improving economic results were realized as a result of the perseverance in the reform of the system of organization, the transfer of power to the lower levels domestically, the opening up to the outside world and the reliance on technological progress, all of which have strengthened the vitality of the enterprise. He indicated that the Wuhan Iron and Steel Corporation has the potential to gather up its strength to render even greater contributions during the "Seventh 5-year Plan" period.

Yesterday, 12 November, Xu Yuanjiu [1776 0626 0036], deputy chief accountant of the Wuhan Iron and Steel Corporation, announced that the corporation has put forth the goal early this year of surpassing 1 billion in profits taxes. As of 9 November, it has victoriously fulfilled its goal 52 days ahead of schedule, with an increase of more than 100 million yuan compared to that of last year.

YANSHAN PETROCHEMICAL 1985 PROFIT TAX 1.3 BILLION YUAN

Beijing JINGJI RIBAO in Chinese 2 Dec 85 p 1

[Report by reporters Deng Wei [6772 4850] and Zheng Bo [6774 3134]: "Yanshan Petrochemical Turns Over to the State 1.3 Billion Yuan This Year"]

[Text] The Beijing Yanshan Petrochemical Corporation, in which there are over 50,000 staff and workers, will fulfill 2.6 billion yuan of gross industrial output value and will deliver 1.3 billion yuan of profit taxes to the state this year. During the "Sixth 5-Year Plan" period, the corporation has delivered a total of 6.16 billion yuan in profits and taxes to the state, ranking third in the country after the Daqing Oil Field and the Anshan Iron and Steel Corporation. In several weeks we will enter into the "Seventh 5-Year Plan" period. The corporation's goal is to deliver 10 billion yuan in profit taxes in the 5 years from 1986 to 1990.

The corporation is a modernized enterprise which ranges from oil refining to petrochemical production. The corporation has persevered in putting reform in the position of first importance, promoted the methods of managing modern enterprises, digested and absorbed imported technology and equipment, tapped potentials and accelerated the transformation of the enterprise from a purely productive mode to a business-development mode.

The leadership of the corporation indicated that, in order to revitalize a large-scale enterprise, we must first of all do well inside the enterprise. The corporation has drawn up 10 strategic targets of management and a program for development for 1986-1990. This year, we have begun to carry out the director responsibility system at all levels, from the manager of the corporation to the factory director and the section chief, who during their terms of office will implement the objectives at their respective levels. We have implemented the diverse economic responsibility systems with contracting as the center. Each contract is closely linked with economic results. This has aroused the enthusiasm of all cadres and workers.

On what basis could the Yanshan Petrochemical Corporation propose to deliver 10 billion yuan in profits and taxes for the 5 years during the "Seventh 5-Year Plan" period? With the exception of the oil refining and processing equipment, most of the production facilities of the major products of the corporation, such as polyethylene and polypropylene, are imported. Currently, they have basically reached the technical index of similar facilities abroad. In order to make production breakthroughs, the keys are to emphasize technological transformation and tap production potentials. In 1984 the corporation invested 51.95 million yuan in technological transformation. More than 100 projects have been completed, yielding 27 million yuan in profits in the same year. This year, over 90 million yuan were invested, yielding a profit of more than 30 million yuan.

In order to realize the corporation's business objective of the "Seventh 5-Year Plan," another key is to make great effort to improve the level of business management, improve product quality and lower consumption. In light of the current level, the corporation's daily output value is over 7 million yuan. This figure has surpassed the sum total of the daily output value of the system under the Beijing Second Light Industry Bureau. The corporation is considering a more efficient management system to better adapt to reform, relaxation and revitalization. Currently, the various plants have established business decision-making consulting organs, strengthened the information network system, strictly implemented management by objective with quality as the key, as well as vigorously set up the tertiary industries in an effort attain a high-efficiency operation for the entire enterprise.

Whether a large-scale enterprise succeeds or not depends first of all on the enterprise's own effort. Whether or not society can join it in the creation of better conditions is also extremely important. Currently, the Yanshan Petrochemical Corporation is worried greatly about the problems which the large-scale enterprises are generally facing: Too little autonomy, too many supervisors, too many apportionments and too many collective investments. Some departments have asked for help by concocting various pretexts. During our interview, we encountered a film studio which was asking for an astonishingly large amount of "support funds." This year the corporation was compelled to put up various "support funds," the amount of which left people breathless. During the "Seventh 5-Year Plan" period, we must handle these problems properly, or we will prevent the further development of the production enthusiasm of the large-scale enterprises.

NATIONAL POLICY AND ISSUES

EFFECT OF PRICE REFORM ON COMMODITY PRICE INCREASES

Kunming YUNNAN RIBAO in Chinese 10 Jan 86 p 3

[Article by He Han [0149 3352]: "Will the Reform of the Price System Lead to a Widespread Spiraling Increase in Commodity Prices?"]

[Text] For a period of time, some consumers have been concerned as to whether or not the state's readjustment of some commodity prices and the reform of the price system would cause a widespread spiraling increase in commodity prices. It is our belief that these concerns are understandable, but should be put to rest.

First, we should carefully distinguish between today's price reform and the widespread upward spiral of commodity prices in old China. During the rule of the KMT, in particular the years right before the liberation, widespread upward spirals in commodity prices often occurred. The ruling authorities at the time were hopelessly corrupt politically, production was severely disrupted and there was an extreme shortage of goods and materials. The regime relied primarily on foreign credit and the indiscriminate issue of paper currency to maintain itself, and commodity prices rose wildly. In June of 1937, 1.41 billion yuan of legal paper tender was issued. By May, 1949 that sum had increased to (203 quintrillion, 837 quadrillion, 400 trillion) yuan (converted into KMT paper currency from gold dollars), which was 144.5 billionfold more than on the eve of the war of resistance against Japan. If, for instance, you had deposited 2 billion KMT yuan in a bank before the war--actually this would have been impossible, as this sum is too large and approaches the figure for the total amount of currency issued at the time--after several conversions and depreciations in the rate of exchange, that sum would have been worth 1 yuan in gold dollars by the "currency reform" of 19 August 1948, with which you could not have even purchased 5 liters of rice. By May 1949, that 1 yuan could not have even bought one single grain of rice. Some comrades suffered from the inflation of the old society and still retain vivid memories of it. In addition, due to the gradual development since the liberation of the idea that "stabilizing commodity prices means freezing them," they feel rather uncomfortable with the slightest readjustment of commodity prices and are concerned about whether or not a new spiral of price increases will begin. It should be noted that the present reform of the price system is being conducted in very good times, economically and politically, and that commodity prices are not being readjusted in response to bad times. The purpose of the price reform is to put commodity prices in order, promote the further continued development of the national economy and to further improve the living standards of the masses of the people. Both in regard to the premises and purposes of the reform, the situation is entirely different from the KMT period before the liberation. Therefore, a widespread spiraling increase in commodity prices will not occur today.

Second, our reform of the price system does not entail an overall increase of all commodity prices, but is a structured readjustment of an irrational price system. In recent years, the state has begun a structured reform of the lack of price differentials for commodities of the same category but of varying quality, irrational price ratios among different commodities, and the situation in which sales prices of primary agricultural byproducts were lower than state purchasing prices. Throughout the reform, prices have both risen and fallen. For example, from 1978 to 1984, purchasing prices for agricultural products rose nearly 50 percent; the overall price ratio between industrial and agricultural prices shrank 30 percent; the price of coal rose 38 percent, products of an raw materials for the metallurgy, chemicals, and construction materials industries rose approximately 50 percent. Prices fell and rose to an equal extent for consumer goods, such as light industry products, textiles, and medicine; prices of electronic goods fell nearly 20 percent in the last 6 years, however. Due to excessive demand, prices for products such as televisions, refrigerators and washing machines cannot fall. In the next several years, the numbers of products will increase and their prices will gradually decrease. Although since the loosening of restrictions, the prices of products such as pork, vegetables, and fruit have risen, sometimes excessively, product variety and quality have improved, purchasing is more convenient and the consumer has gained as well as lost. Now that production is developing, prices will stabilize and even fall a little. From this approach, it is clear that the reform of the price system does not mean wholesale increases, but rather both decreases and increases. The belief that there will be endless price increases leading to a widespread upward spiral is baseless.

Third, the state's reform of the price system is a guided, planned, supervised one. The central authorities have put forth the principles of prudence and stability, and have taken a series of correct policies, in regard to the reform, have proposed the principle of conducting reform based on the development of production and the premise of ensuring the gradual increase of the people's real income, and devised detailed, really feasible programs and measures. In regard to the disposition of reform methods, the guiding concept is "integrate lossening of restrictions with readjustment; look before taking each small step." Beginning with the inception of the plan last year, 5 years' time will be needed to basically reorder China's price system. Larger adjustments in commodity prices are to be determined by the state. Anything that exceeds a certain level will not be allowed. The state will take firm measures to control the overall level of market retail prices. While resolving the problem of the underpricing of agricultural byproducts and readjusting the prices of consumer goods, we must take solid steps to ensure that the living standards of the vast ranks of urban and rural residents will not fall because of price adjustment. Yunnan took four major steps in implementing the price reform last year based on these principles and plans. These included the loosening of restrictions on the prices of pigs, adjusting the price of rural grain, raising the cost of short distance rail shipping, and adjusting price differentials and ratios for coal. Good results have already been achieved in these four areas. Practice has shown that these principles, policies and measures are major guarantees in ensuring the smooth implementation of the price system reform and in maintaining basic stability for commodity prices.

Of course, some excessively large price hikes have occurred for some commodities since last year. With the exception of normal, rational price increases and indiscriminate price raising by some industrial and commercial enterprises and self-employed peddlers who took unfair advantage of the reform, most of the increases were due to the overly rapid growth in extra-budgetary expenditure for fixed assets, the excessively swift development of industry, the large scope of capital construction and the sudden growth of credit and consumer funds which led to shortages and overly high prices of some commodities on the market, especially nonstaple foods. However this is a temporary problem that has occurred in the course of the reform of the price system. It does not mean that there has been or will occur a widespread spiraling increase in commodity prices. We are aware that the cause of such a phenomenon is an extreme shortage of goods and materials and the failure of supply to meet demand, which leads to huge increases in commodity prices, and the great increase by the government of the issuance of currency, which causes a vicious cycle of inflation, and so on, whereas today we have a plethora of goods and materials, and the state has not issued a huge amount of currency. As for the issuing of some extra currency in the fourth quarter of 1984, the central authorities took firm measures as soon as the problem was discovered to contol the scope of investment in fixed assets and to control the excessively rapid growth of industrial production, the amount of currency issued, and consumer funds, so that they would not exceed the production rate of consumer goods. This is the most fundamental method that could be taken in controlling commodity prices. At the same time, the state also took strong measures to greatly increase production of salable, popular consumer products, to gain flexible mastery over export-import policy, to readjust and balance domestic supply, withdraw currency from the market, improve management, supervision and inspection of commodity prices, and so on. These measures have already achieved remarkable results, which is effective proof that our party and state gained valuable experience during the early period of construction and the time of difficulties in the 1960's in stabilizing commodity prices, and that they can, in the course of the present reform of the price system, make a complete and timely resolution of problems that have occurred in the price reform to ensure the smooth conducting of this reform so vital in relation to the entire nation.

ECONOMIC MANAGEMENT

IMPROVING MACROECONOMIC CONTROL TO AID ECONOMY URGED

Kunming YUNNAN RIBAO in Chinese 10 Jan 86 p 3

[Article by Zhang Huaiyu [1728 2037 3254] and Xu Yafei [1776 0068 7236]: "Improve Macroeconomic Control To Ensure the Continued Development of the National Economy"]

[Text] The law of social reproduction requires the even, coordinated functioning of the national economy. The law of value and of planning require the proportionate distribution of social labor and the planned organization of social and economic life. All this necessitates the maintenance of balance in the macroeconomy and appropriate controls over microeconomic activities. The present overall price reform calls for consciously maintaining macroeconomic balance and the use of the law of value and other economic levers in the microeconomy, taking administrative and legal measures when necessary to effectively control and interfere, to enable the entire economy to automatically adjust itself to a lively but not disordered fashion and to advance in an organized manner.

Macroeconomic balance requires, first, a basic balance between social supply and general demand, that is, a balance between the overall social product and social consumption. This is the most fundamental prerequisite in the smooth functioning of social and economic life. When supply is greater than demand, waste of public wealth occurs; when demand is greater than supply, there are shortages of goods and materials, commodity prices rise and needs involved in production and in daily life cannot be met. This should be patently clear. According to economic principle, overall social supply refers to society's net production output value in a given year, plus the cash surplus from the year before, minus the amount of value on reserve for the following year. It is the overall volume provided for social consumption (this includes both consumption involved in production and in livelihood). In China we usually compute this according to the national economy. Overall demand refers to the demand based upon the ability to pay and refers to the sum of all expenditures. In China we generally calculate this in terms of the sum of accumulation and consumption. The balance between overall social demand and supply refers to the balance of the magnitude of value; and represents the balance of the magnitude of value between the demands based upon the ability to pay and the overall production of that society can supply. Recently, there has been a debate in Chinese economic circles regarding the problem of macroeconomic control, or more specifically, how to dispose of and deal with the interrelated problems of overall social supply and demand, macroeconomic controls and economic reform. In the CPC Central Committee's proposals for the Seventh 5-year Plan and in Premier Zhao Ziyang's explanation of it, a clear answer has been given: The reform requires both a free environment and a definite speed. However the speed cannot be too rapid, and the term "free environment" is a relative one. We cannot wait until all conditions have been met, a buyer's market has been formed and the environment has been put into perfect order to begin the reform. We can, however, achieve a basic balance between overall demand and supply via reform which would create a buyer's market in which supply is slightly greater than demand.

In view of China's current national conditions, the focal point of the readjustment of the balance of overall social supply and demand lies in the adjustment and control of demand. Overall social demand is derived from three sources--one is enterprise expenditure; the second is state financial outlay, and the third is credit expenditure. Under usual conditions, enterprise and state financial expenditures remain within the limits of income. Without credit support from the banks, overspending is unlikely. Enterprise overspending relies on bank credit, without which the enterprise has no money to spend. Governmental overspending is caused by deficit spending, credit, and the overissuance of currency, three methods which stimulate inflated demand and cause demand to be greater than supply. Credit will inflate by itself, when credit exceeds savings, and when there exists said credit in the absence of savings. All this can form a total volume of currency that can pay for the overall demands, to exceed the total value that can be supplied by social commodities and an overdistribution of the national income. Therefore, controlling the scope of credit and the issuance of currency are key measures in the macroeconomic control over the balance of overall supply and demand.

Second, the disposition of accumulation and consumption must be appropriate. This involves two problems: One is the necessity for an adequate ratio between accumulation and consumption. Accumulation cannot squeeze out consumption, and consumption cannot be undertaken without regard for national construction. Expanded socialist reproduction must be ensured. Excessively high or low rates of accumulation or consumption are not appropriate, a fact concerning which we have learned a painful lesson. This is an important problem that relates to macroeconomic balance. An overly large scope of investment in fixed assets creates shortages of goods and materials and the inflation of credit. Work on key construction projects cannot be guaranteed, basic industries, such as energy, communications, transportation, posts and raw materials, get short-changed and the entire national economy is characterized by shortages, all of which are detrimental to the sustained, steady, coordinated development of the reform and the national economy. To deal with this, it is necessary, in addition to utilizing the method of compensated investment, to also take some direct and indirect measures to control the overall scope of fixed-asset investment, especially extra-budgetary expenditures. These control methods must be solid and effective ones.

The second problem involves preventing accumulation and consumption from exceeding the national income and overall supply. To control the overall scope of accumulation requires control over the overall scope of consumption. China is a socialist nation, and the constant elevation of the people's living standards is a goal of socialist production and a fundamental principle in our economic work. However, China is also a developing nation, and the elevation of living standards cannot become divorced from the development of production, actual economic conditions, and China's national characteristics. Blindly seeking after high consumption, the unrestricted increase of wages, indiscriminate issuance of bonuses and increases in social welfare measures are wrong and will inevitably lead to the inflation of consumption, which will effect the balance between overall social demand and supply. The state should improve direct and indirect management over wage funds so that the growth rate of wages remains lower than the rate of increase in labor productivity.

The foundation of macroeconomic balance involves balanced finances, credit, goods and materials, and foreign exchange. Once these four categories are balanced, overall supply and demand can be controlled, accumulation and consumption can be adequately disposed of, and all departments of the national economy can be developed in a coordinated fashion. From the macroeconomic point of view, this requires a rational ratio and balanced coordination for all departments, industries, and construction projects, a reasonable disposition of social labor and automatic adjustment and control on the part of all economic mechanisms, in particular the indirect control of the macroeconomy over the microeconomy.

Improving indirect macroeconomic adjustment over microeconomic activities is critical. Recently, due to the reduction of the scope of the directive-type economic planning and direct administrative interference and the poor start of the indirect utilization of the regulatory role of economic mechanisms, the newly built system was incomplete and control was lost over the scope of fixed-asset investment, consumer funds, credit, and the issuance of currency, which caused fairly large increases in commodity prices. This has provided us a negative object lesson in the importance of macroeconomic control and regulation over the microeconomy. In its proposal, the Central Committee stressed that great efforts must be made to improve the ability of the state to indirectly control all economic activities, and to energetically strengthen and perfect systems and methods of indirect control. It also pointed out that the reduction of the scope, level and plans of direct control over microeconomic activities should be in accord with the state's ability to improve indirect controls. This is of great significance, as the Central Committee also regards the adherence to maintaining a macroeconomic balance between overall social demand and supply as a fundamental, vital guiding principle in the economic work entailed in the Seventh 5-year Plan.

ECONOMIC MANAGEMENT

ON INCREASING MANAGEMENT OF ECONOMIC CONTRACTS

Beijing RENMIN RIBAO in Chinese 10 Mar 86 p 4

[Article by Fang Chu [2455 0443]: "Strengthen Management of Economic Contracts"]

[Text] In recent years, among legal entities, between legal entities and individual management operations, and between citizens, in order to enact a definite economic purpose, many people have drawn up economic contracts. It is indeed a happy phenomenon that people are resorting to legal means in managing the economy. Yet based on the numerous cases of disputes over economic contracts, control over economic contracts must be enhanced so as to protect the legal rights of parties to a contract and to maintain order in the socialist economy.

An economic contract is a kind of economic device to effectuate the exchange of goods and is a kind of legal binding that clarifies the rights to be enjoyed and the duties to be borne by the concerned parties. Economic contract law stipulates that when establishing a contract, the principle of legality must be respected and that the contract cannot run counter to the nation's laws and policies. After a contract is established, parties to the contract are under legal restraints and must fully carry it out. He who defies it must bear the consequences of that violation. Judging from current cases "within the scope of legal institutions," there are quite a few units that have a superficial notion of the legal system and fail to recognize the legal effectiveness of a contract. This is mainly manifested in the following ways: 1. The establishment of illegal contracts. Some units basically fail to fully honor the contract and even sign contracts with others; others use contracts to carry out fraudulent activities. 2. Contracts are not carried out after their creation and some are even torn up. 3. Rulings of the People's Court in cases of economic disputes are difficult to execute. This illustrates the necessity of bolstering management of economic contracts. At the same time, it also demands that agencies whose function is to administer the government, manage industry and commerce, and issue bank credit must strictly follow through with their professional responsibilities. Business licensing must also be strictly controlled. Contracts must be diligently examined if they are going to be established. Illegal activities such as bogus contracts, the use of contracts for fraudulent sales or purchases, and the transfer of contracts in order to reap an undeserved gain must be resolutely dealt with according to the law. Judgements, rulings and mediated settlements reached by the People's Court in cases of economic disputes must be carried out.

In dealing with economic contract disputes, attention must be focused on discovering and attacking illegal economic activities. Regardless of what level of an organization or what level a cadre is implicated, cases must be conscientiously investigated. The criminally negligent must be investigated and held accountable, and economic penalties cannot be substituted for criminal penalties. Neither party nor government discipline can be substituted for punishment according to the law. Proven economic crimes cannot be treated as mere evil winds and crimes involving dereliction of duty cannot be treated as mere bureaucratism. By no means can economic criminals be let off the hook.

QINGHAI LEADER CALLS FOR PROMOTING LATERAL TIES

HK010649 Xining Qinghai Provincial Service in Mandarin 2230 GMT 31 May 86

[Excerpts] The provincial government held a mobilization meeting in Xining on 31 May, calling on all areas, departments, and enterprises in the province to enhance understanding and speed up the establishment of lateral economic ties. Leaders of the provincial CPC Committee and government including Song Ruixiang, Liu Feng, Bian Yaowu, and Wu Chengzhi attended the meeting. (Yang Shouru), director of the Hangzhou City Economic Research Institute, was also invited to attend.

Vice Governor Wu Chengzhi delivered a mobilization report. He reviewed the province's achievements in establishing lateral economic ties in recent years and pointed out [words indistinct]. He said: Compared with fraternal provinces and regions, Qinghai lags far behind in the establishment of lateral economic ties. We are only in the initial stage. There are many imposed ties between enterprises but not many voluntary ties. Some enterprises still have the idea that they will get the worst of it if they establish lateral ties with others.

He expressed the hope that all areas, departments, and enterprises would unify their thinking and gain further understanding of the importance of lateral economic ties. They should eliminate the fear that, after establishing ties, large enterprises will have extra burdens to carry while small ones will be swallowed up. They should eliminate the mentality of only being concerned with their own development and being unwilling to help others. The question of the economic results relationships of all parties in lateral economic ties must be properly handled.

Wu Chengzhi said that Qinghai's lateral economic ties should be focused on exploiting its strong-point resources and on the in-depth processing of raw materials. It is also necessary to improve product quality and develop new products. The focal points in lateral ties this year are the processing of clothing and the direct supply of materials for woolen textiles.

GANSU MEETING DISCUSSES ECONOMIC WORK TASKS

HK100333 Lanzhou Gansu Provincial Service in Mandarin 2200 GMT 9 Jun 86

[Excerpts] The provincial government held a telephone conference on the evening of 9 June to make specific arrangements for the province's economic work in the next 4 months. Governor Jia Zhijie presided.

Vice Governor Zhang Wule made a speech. He said: The province's industrial production this year is facing a serious situation of squeeze at both ends and tension in the middle. One end is that, although industrial output in the previous 5 months rose somewhat compared with the same period last year, it did not keep up with the rate of progress required by the plan, thus putting more pressure on future work. The other end is that production in the fourth quarter will be affected by power shortage. This means that the tasks will all be concentrated in the middle 4 months of the year. This requires that production plans be arranged ahead of schedule and that work make rapid progress.

To ensure the fulfillment of production plans, the provincial authorities have acted in a coordinated way and tapped potentials to ensure that there will be no power restrictions in the next 4 months and that communications and transport can be assured. At the same time, we have collected 5,000 tons of steel plus a monthly 70 to 80 million yuan in floating capital to meet urgent requirements in production.

Zhang Wule said: The next 4 months are the key period for fulfilling the year's plans. We must have a sense of urgency and persevere in a scientific, truth-seeking approach in our work.

He pointed out: The enterprises must unswervingly implement the plant manager responsibility system and delegate the managers' powers to them. Enterprises that have not yet done this must do so as soon as possible, and those where the managers' powers have been taken away must restore them. In exercising their powers, the managers must listen as much as possible to the opinions of various sectors, to reduce disputes and mistakes to the minimum. Attention must be paid to solving any policy problems that arise in reforms.

Vice Governor Lu Ming put forward views on arrangements for agricultural work. He said: We must continue to fight drought and other natural disasters, and also get a good grasp of autumn sowing and of agricultural construction, to create good conditions for next year's production.

XUE MUQIAO DISCUSSES INDIVIDUAL ECONOMY

Beijing JINGJIXUE ZHOUBAO in Chinese 20 Jan 86 p 1

[Article by Tan Rongyao [6223 2837 1031]: "Xue Muqiao [5641 2550 2890] on Individual Economy in Zhejiang"]

[Text] Noted economist Xue Muqiao, along with an involved comrade from Zhejiang Province, recently studied development of Wenzhou's rural commodity economy. He has several opinions concerning the question of the individual economy.

Xue Muqiao said that currently China's individual economy is growing faster than the collective economy, and that the collective economy is growing faster than the state economy. The explanation for this is two-sided: First is that production and business are thriving more in the individual than in collective economy, and more in the collective economy than in the state economy. Second, the burdens are inequitable; individual and collective responsibilities are universally lighter than those for the state. Also, most of the profits retained by individuals and collectives they themselves can utilize to expand production. The rise of an individual economy really is not all that frightening. The problem is to get the individual, the collective, and the state competing along the same lines. State enterprises cannot be managed too oppressively nor too stringently. In bringing forth modernization, it is important for there to be a suitable dependence on state enterprises, yet currently state-run enterprises are not competitive with the individual or the collective economy. The nation must strengthen management of the individual economy. Special regulations regarding tax collection must be considered in dealing with Wenzhou's individual rural economy. At the same time, the administrative government's commercial and industrial management departments must be strengthened, as should the tax department. To be sure, the thinking and working style of these market management structures must be upright and only then can taxes be collected. Otherwise, if these structures are somehow connected with individual enterprises, the market will be difficult to manage. Money received illegally by these structures must be confiscated and brought to a halt. Yet by stressing management of the individual economy, and emphasizing that the individual, collective and state economies must compete along the same lines, will this not result in the individual and collective economies being squeezed out? The answer is that it will not. In the future, state enterprises will mainly be involved in large-volume production, making products that require high technology: It will not be involved in anything and everything. The state enterprises will leave small commodities and lower volume production for collectives and individuals to handle. In this way, the state, the collective, and the individual can grow in tandem, and at the same time this would preserve the leading role of the state economy.

Regarding the question of hiring among rural individual enterprises, Xue Muqiao said that when he was investigating the Pujiang region of Fujian, he discovered a family-run factory that employed more than 200 people. In 1 year it made between 300,000 and 500,000 yuan in profit; it was also able to export its products and bring in foreign exchange. This kind of factory cannot be prohibited. Because first off, if it were shut down, many people would lose their jobs. Second, society requires exports that create foreign exchange. However, if these types of factories can attract and inspire workers to become stock holders and collect dividends, paving the way toward a joint stock economy, then by all means they cannot be suppressed. If workers invest in stock, then 300 or 400 workers is acceptable. But in general these factories only employ about 100 workers, which explains why these family-operated plants produce items which meet market demand. This method is applicable in Wenzhou. All in all, regarding the hiring question, China does not require a single practice, nor does she require a single policy.

Private banks are illegal under Chinese law. But if rural credit unions are not restructured or invigorated, then private banks cannot be banned; if the main route is not wide enough, then the backroads must remain viable. China's exchange rate was very weak in the past, with the HK dollar officially pegged at 0.3 RMB. But on the black market it rose to 0.8 RMB and it could not be halted. Later the posted rate was adjusted and the black market rate fell off. At present, prices, interest rates, tax rates and exchange rates are all very weak. Wenzhou must find a set of special policies adjusted to the special characteristics of Wenzhou's economic development. For example, credit unions could establish a floating interest rate. But if credit unions are not given a shot in the arm, private banks cannot be outlawed, for if they were, production and the circulation of goods would be hindered.

Xue Muqiao says that China must push for the development of the state economy, but it must not negate the function of the individual economy. Development of an individual economy is an essential way to expand the rural commodity economy. It is a product of the initial phase of industrialization, so we must take it seriously and promote its healthy development.

SHANDONG'S LIANG BUTING ATTENDS INDUSTRIAL PRODUCTION MEETING

SK050953 Jinan DAZHONG RIBAO in Chinese 21 May 86 p 1

[Text] The provincial industrial and communications production conference was held in Taian City from 16 to 18 May. The conference focused on studying the issues of how to solve the problem whereby industrial production shows decline in the third quarter of the year, how to reverse the situation in which some products are poor in quality, how to reduce consumption, and how to raise the economic results. The conference called for efforts to grasp reform; to further arouse the enthusiasm of the enterprises, staff members and workers, and the localities; and to strive to maintain an appropriate growth rate in this year's industrial production.

Attending the conference were more than 120 people, including chairmen of the city and prefectural economic commissions; responsible comrades of the provincial-level industrial, communications, financial and trade departments and bureaus; and responsible comrades of some enterprises.

Liang Buting, secretary of the provincial CPC Committee; Gao Changli, Standing Committee member and secretary general of the provincial CPC Committee; and Ma Shizhong, vice governor of the provincial government, attended the conference. Comrades Liang Buting and Ma Shizhong respectively delivered speeches at the conference.

After analyzing the situation of the industrial production in the first 4 months of this year, the conference held that the province's industrial production situation in this period was generally good. The cities where industries are concentrated registered a substantial increase in industrial production. The production of daily consumer goods, raw materials, and electricity increased with comparatively fast speed. Town- and township-run industrial enterprises and village-run industrial enterprises maintained a higher production growth rate. The increases in the income of the industrial enterprises and the profits and taxes handed over to the higher levels by these enterprises were higher than the increase in industrial production. Local industrial enterprises registered notable increase in creating foreign exchange through export. The prominent problems in the current industrial production are as follows: The quality of products is not stable enough. The consumption of raw materials is relatively high, and the production cost is rising. The situation in safety production is not good.

The conference pointed out: In order to maintain an appropriate production growth rate on the premise of raising the economic results, the industrial and communications front should grasp the following few tasks at present: 1) Seek unity of thinking, have firm confidence, and conscientiously solve the problem whereby industrial production shows decline in the third quarter of the year. After viewing the historical situation, we have come to know that the industrial production in the third quarter of the year was less than that in the second quarter. So, we must take effective measures to change this situation this year. In accordance with the demand of making the production in the third quarter not less than that in the second quarter, we should give priority to supplying raw materials, energy resources, and funds and rendering transportation service to the enterprises producing readily marketable products and to those with capacity to increase their production, and try every possible means to increase the industrial production. The problems that can bring greater impact on the production should be solved conscientiously. We should make good arrangements for examining and repairing the equipment in an effort to shorten the time for examination and repair. 2) Rapidly solve the problem whereby the quality of some products becomes poorer and poorer. We should immediately launch a provincial-wide drive for examining the quality of products. Defined responsibility for ensuring product quality should be involved in the economic responsibility system. No bonuses shall be granted to staff members and workers of the enterprises who fail to attain the quality targets. 3) Firmly grasp the work of reducing consumption and vigorously raise the economic results. We should resolutely carry out the policies on saving and reducing consumption. We should adopt measures for strengthening management and conducting technological transformation to reduce the consumption of goods and materials.

The conference stressed: We should make achievements in reform in order to facilitate industrial production. At the time when the old system is being replaced by a new one, we should transfer the power to handle certain problems to the cities, prefectures and enterprises in order to bring into full play the enthusiasm of the workers, enterprises, and localities. We should firmly implement the economic contract responsibility system and safeguard the dignity of the system. We should carry out on a trial basis the system of factory heads taking the responsibility for the operation of the factories, and pay attention to drawing a clear distinction between the regular management activities of the enterprises and the unhealthy practices.

BRIEFS

COOPERATIVE ORGANIZATIONS PRODUCTIVITY--Beijing, May 31 (XINHUA)--China has set up 20 trans-regional economic cooperative organizations, an official of the State Planning Commission has stated. These organizations make full use of local natural resources, promote productivity and encourage enterprise cooperation. There are three types of trans-regional cooperation, the official said. One is made of administrative regions such as the Shanghai and northeast China economic zones and cooperative zones in southwest, south, northwest, north China; one covers neighboring areas, like the Huaihai economic zone which consists of 15 prefectures and cities in Jiangsu, Anhui, Henan and Shandong provinces; and the third is among cities as the city economic combine made up of Shanghai, Nanjing, Wuhan and Chongqing along the Yangtze River valley. The northeast China economic zone, the official said, consists of Liaoning, Jilin and Heilongjiang provinces and east Inner Mongolia autonomous region. More than 4,000 agreements on transportation, energy and raw material development have been concluded over the past 2 years. These items will help generate additional output value of more than three billion yuan a year. The zone has turned out coal, cement, rolled steel, timber and glass and opened 32 trunk highways to link the provinces and region. [Text] [Beijing XINHUA in English 0542 GMT 31 May 86 OW] /8918

GANSU: NEW CONCEPTS, REFORMS IN COMMERCE--Li Ziqi said in a speech at a provincial conference of commerce bureau chiefs on 6 June that commerce workers should establish new concepts and promote the development of reforms. After reviewing the achievements in reform, Li Ziqi pointed out that the comrades at all levels and of all departments must put reform in the first place, strive to create a political situation of harmony and concord, create an excellent environment for the reformers, and protect and perfect their reform work. On commerce reforms, Li Ziqi said that it is necessary to embrace the following concepts: 1) Firmly embrace the concept of providing guidance for production, services, and consumption, and oppose the idea of business purely for the sake of business. 2) Firmly embrace the concept of putting service quality first. 3) Embrace the concept of competition. This year we must start with the key cities in reducing the number of links in the wholesale chain, and develop new links in conjunction with competition. 4) Firmly embrace the concept of economic results. [Excerpts] [Lanzhou Gansu Provincial Service in Mandarin 2200 GMT 6 Jun 86 HK] /6091

DEFENSE INDUSTRIES AID CIVILIAN ENTERPRISES--Shaanxi's defense industries, long in an isolated role, have in recent years turned over a new leaf and have been actively aiding county and township and town enterprises, thus contributing to the invigoration of the local economy. Currently, among the 128 enterprises and facilities, 75 defense industry enterprises and county, and township and town enterprises from 34 counties have set up cooperative efforts. According to a recent survey of 23 enterprises, within the entire system more than 500 technicians of various kinds have been trained in local enterprises below the county level, more than 300 pieces of various equipment have been transferred, and more than 300 tons of various raw materials in short supply have been supplied. Consequently, the technological and managerial level of these enterprises has improved significantly. [Text] [Xian SHAANXI RIBAO in Chinese 15 Feb 86 p 1] 13030/12781

FINANCE AND BANKING

FINANCIER DISCUSSES FOREIGN EXCHANGE CERTIFICATE ABOLITION

Hong Kong CHING-CHI TAO-PAO [ECONOMIC REPORTER] in Chinese No 14, 14 Apr 86 p 23

[Interview by reporter: "Wu Nianlu [0702 1819 7627], Acting Director, International Finance Institute of the Bank of China, Comments on the Abolition of Foreign Exchange Certificates and Other Financial Matters"; date and place not given]

[Text] Wu Nianlu, acting director of the International Finance Institute of the Bank of China, who attended the "Chinese Foreign Trade and Investment Conference" recently held in Hong Kong, commented on and supplied answers to questions concerning China's currency and financial problems, some of which are of considerable interest to overseas readers. With a view to ensuring the accuracy of what he had said at the conference, the reporter called on Mr Wu with the request that he supply answers to the questions that follow.

[Question] When do you think foreign exchange certificates will be abolished?

[Answer] Once preparatory work has been completed, the People's Bank and the concerned financial authorities will announce the exact date for the abolition of foreign exchange certificates. The question was asked by some reporters at the conference whether it will come only after 1990. My personal opinion is that it will not. As to how long the preparatory work will take, I do not have the answer since the International Finance Institute of the Bank of China is taking no part in the preparatory work.

[Question] Will the Bank of China continue to engage in foreign exchange adjustment operations? A foreign exchange adjustment center has already been set up in Shenzhen. Will such centers be established in other regions?

[Answer] With the approval of the State Administration of Exchange Control of the People's Bank, the Bank of China has been engaging in foreign exchange adjustment operations in recent years. The purpose of such operations is to invigorate foreign trade and foreign exchange funds and to make full use of such funds, so that the departments, enterprises and units with surplus foreign exchange reserves may make such surplus funds available to units which are short of foreign exchange and in urgent need of such funds. The adjusted price for such funds is 10 percent higher than the list price. In view of the excess of demand over supply, such operations were virtually brought to a halt last year. The resumption of such operations is currently under consideration. To offer an incentive to sellers, the adjusted price is likely to be set at more than 10 percent over the list price. The resumption of foreign exchange adjustment operations will serve to promote import and export trade and lateral economic relations. The establishment of a foreign exchange adjustment center in Shenzhen does not mean, however, that such centers will be set up throughout the nation. In fact, the Bank of China has given no consideration to the setting up of such centers. The policy and principle of foreign exchange adjustment are set by the State Administration of Exchange Control.

[Question] Would you comment on the situation relating to the raising of funds by the selling of bonds and tell us about future plans?

[Answer] From January 1982 to February 1986, China issued 15 bonds of various types in Japan, Western Europe and Hong Kong amounting to some $1,226,000,000. During the last 10 days of March 1986, the Bank of China issued change-over U.S. dollar bonds in Japan amounting to 20 million yen. In April or a little later, bonds may possibly be issued again in Japan. Specific figures and conditions are not yet known. In the future, we shall give further consideration to the issuance of various types of bonds in Japan, Western Europe, Hong Kong, Singapore and the United States. However, the issuance of bonds in foreign countries has to have the approval of the State Administration of Exchange Control of the People's Bank.

[Question] Please comment on the problem arising from the failure of the branches and subbranches of the Bank of China to make payment for letters of credit in fulfillment of their obligations.

[Answer] Last year, there were isolated instances where certain domestic branches and subbranches of the Bank of China delayed payment for nonwithdrawable letters of credit issued by the bank even when the documents tallied with the certificates. Although the number of such instances was extremely small, the prestige of the bank has suffered as a result. The Bank of China is a specialized bank engaged in foreign exchange operations and enjoys considerable international prestige. In the future, the Bank of China must fulfill its obligation to make payment for such letters of credit it has issued so long as the documents tally with the certificates regardless of whether or not the importers are able to make payment under whatever circumstances. In that regard, businessmen in Hong Kong can set their minds at rest.

[Question] What is your impression of your visit to Hong Kong?

[Answer] I am extremely gratified to have had the opportunity to participate in the "Chinese Foreign Trade and Investment Conference" sponsored by the Trade Development Bureau and the International Trade Information and Research Center and to have made the acquaintance of a number of friends in industrial and commercial circles as well as newspaper reporters in Hong Kong. With the further reform of China's economic structure and the progress made in the legislative system, the open door policy is bound to be further extended. The current economic situation in China is extremely favorable. I am convinced that the prospects of Hong Kong are extremely bright for developing economic and trade relations and for making investments in China.

Finally, permit me to express my heartfelt appreciation to the Hong Kong ECONOMIC REPORTER for having reported accurately my answers to questions put to me by members of the audience and reporters during the course of the conference.

BANK OFFICIAL URGES CHANGES IN INTEREST RATE SYSTEM

Hong Kong TA KUNG PAO in Chinese 20 Mar 86 p 3

[Article: "Bank Official Says the Reform of China's Banking System Calls for Changes in the Interest Rate"]

[Text] In his address to a discussion meeting on "The Reform of China's Banking System" sponsored by the Asian Research Center of the University of Hong Kong yesterday, Zhao Haikuan [6392 3189 1401], director of the Finance Research Center of the People's Bank of China, pointed out that whether it is possible to invigorate banking operations in China and to exercise macroeconomic control over China's finances hinges on whether the entrepreneurial type of management is adopted by the specialized banks in China.

Reporters were told that China would consider the establishment of a few additional specialized banks.

In his address entitled "A Discussion of the Reform of China's Banking System," Zhao stated that in order to make it possible for specialized banks to adopt the entrepreneurial type of management, it would be necessary to establish proper coordination between the profits accruing to specialized banks and to the nation as a whole.

He pointed out that, according to the present system, a higher interest rate is set by the state for long-term fixed savings deposits in order to encourage people to take an active interest in making savings deposits, to turn consumption funds into production funds, to increase the amount of construction funds, to defer the recall of that part of the currency as represented by purchasing power, and to adjust properly the circulation of currency in the market. He added that although the setting of a higher interest rate for such deposits is of benefit to the nation as a whole, it has also created accounting problems for specialized banks.

Zhao stated that since the interest rate for savings deposits over the fixed period of 3 years was higher than that for circulating fund loans, the specialized banks would suffer losses by taking in such deposits. As regards bank loans, it is stipulated by the state that a lower interest rate should be charged for enterprises whose operations are well managed, which incur low cost, and whose funds are circulated at a rapid rate, or whose products are of vital importance. A higher interest rate is charged for enterprises which fail to meet the above conditions.

He revealed that while the increase in the number of enterprises whose operations are well managed and the decrease in the number of those whose operations are poorly managed served to increase macroeconomic effectiveness, the income of banks derived from interest payments would be reduced. Conversely, the reduction in the number of enterprises whose operations are well managed and the increase in the number of those whose operations are poorly managed would increase the income of banks derived from the same sources.

Zhao made the observation that, under this interest rate system, the adoption of the entrepreneurial type of management by specialized banks would induce the banks to relax their efforts to absorb long-term fixed savings deposits, to increase the extension of loans bearing a high interest rate, and to reduce the amount of loans for economic construction projects of major significance to the state for which loans should be extended at a preferential rate, thus setting back the economic construction of the state.

To resolve the anomaly mentioned above, he said that it would be necessary, circumstances permitting, to make basic changes in the present interest rate system, that the Central Bank should concern itself with setting the basic interest rate and the range of fluctuations and that specialized banks should be permitted to set specific interest rates within that range. Before such changes are made in the interest rate system, the Central Bank should draw up measures for adjusting the interest rate so that the benefits accruing to specialized banks for absorbing and utilizing credit loan funds may also prove to be of benefit to the nation as a whole.

Zhao expressed the opinion that, aside from taking the above into consideration in reforming the system of domestic banks, economic measures should also be used to strengthen the macroscopic financial system, to further enlarge the scope of banking operations, to increase the types of banking services and to enlarge the authority of banks at the basic level.

CHINA'S FINANCIAL STATISTICS FOR 3D QUARTER 1985 REPORTED

Beijing ZHONGGUO JINRONG [CHINA'S BANKING] in Chinese No 12, 4 Dec 85 p 37

[Text] TABLE 1. STATE REVENUES AND EXPENDITURES
(Unit: 100 million RMB yuan)

Items	Balance at the end of third quarter
Itemized savings	3,577.89
Enterprise	1,355.82
State treasury	388.30
Capital construction	213.70
Government departments and institutions	308.93
Urban individuals	991.86
Rural individuals	319.28
Liabilities to international financial organizations	76.39
Currency in circulation	827.12
Bank free capital	612.60
Carry-over balance in the present year	69.08
Miscellaneous	94.90
TOTAL REVENUE	5,257.98
Itemized loans	4,710.08
Industrial production enterprises	956.82
Industrial supply enterprises and materials department	338.34
Commercial	2,298.87
Equipments (medium or short term)	371.97
Urban collectives and private business	314.20
Advance payments	6.93
State farms	57.38
Rural collectives	365.57
Gold transactions	12.04
Foreign currency transactions	119.99
Assets in international financial organizations	83.78
State treasury loan	275.78
Miscellaneous	56.31
TOTAL EXPENDITURES	5,257.98

Table 2. RURAL CREDIT COOPERATIVES: SAVINGS AND LOANS
(Unit: 100 million RMB yuan)

Items	Balance at the end of third quarter
Itemized savings	654.37
Farm collectives	59.61
Township and town enterprises	62.47
Individual commune members	518.01
Miscellaneous	14.28
Itemized loans	468.91
Farm collectives	46.71
Township and town enterprises	164.20
Individual commune members	258.00

Table 3. EXCHANGE RATE, GOLD AND FOREIGN EXCHANGE RESERVES AND FOREIGN DEBT

Items	July	August	September
Exchange rate :			
One special drawing rights unit -- RMB yuan (at the end of the period)	2.9853	3.0244	3.1444
One US dollar -- RMB yuan (at the end of the period)	2.8778	2.9211	2.9681
One US dollar -- RMB yuan (average)	2.8738	2.9023	2.9626
Gold reserves (in 10,000 ounces)	1,267	1,267	1,267
Total foreign exchange reserves (in $100 million)	119.57	114.60	125.92
Of this: Reserve in State treasury	44.52	38.44	33.77

FINLAND DEVELOPMENT LOAN--Helsinki, June 5 (XINHUA)--Finland has decided to grant a 50 million Finnish markka (U.S. $9.6 million) long-term low-interest development loan to China, the Finnish Government announced today. The loan, the first of its kind, has a 25-year repayment term with a 7 year grace period and an annual interest rate of 0.75 percent. Eighty percent of the loan will be for development projects in which Finland will take part. These include modernizing a Guangzhou pulp and paper mill and the chemical fertilizer production line of a phosphate fertilizer plant in Hubei Province. At the same time, Finland also announced a 30 million Finnish markka (U.S. $5.8 million) development loan to Cameroon. [Text] [Beijing XINHUA in English 1157 GMT 6 Jun 86 OW] /8918

HU PING REPORTS ON FUJIAN INDUSTRIAL DEVELOPMENT

OW090831 Fuzhou FUJIAN RIBAO in Chinese 16 May 86 p 2

[Text] In his report at the Fifth Session of the Sixth Fujian Provincial People's Congress, Governor Hu Ping said: Developing industry is the key to enhancing economic strength and quickening the pace of the four modernizations. During the Seventh 5-Year Plan period, we must strive to develop industrial production in the province at a quick tempo, while placing emphasis on economic efficiency and rational readjustment of the industrial structure. According to the draft plan, the total value of industrial output may reach 25 billion yuan by 1990, marking an average increase of 8.6 percent per year, with output value of light industry increasing by 9 percent and heavy industry by 8 percent per year. This target is not excessively high, and we may even exceed it.

Hu Ping pointed out: In increasing industrial production in Fujian, we achieve our goal mainly by developing technology, improving management, raising production quality, reducing raw material consumption, and increasing economic efficiency. During the Seventh 5-Year Plan period, we must help our existing enterprises increase production by rapidly importing advanced technology, strengthening quality control, and setting up a system that ensures high production quality and reduces energy and raw material consumption. We must further strengthen our basic management work, upgrade enterprise management, and continuously improve the quality of our enterprises.

Hu Ping said: It is necessary to vigorously readjust the industrial setup. 1) We must strengthen our efforts in producing raw materials, including metal and chemical materials as well as construction materials. We must also step up industrial construction; carry out technical innovations at the Sanming iron and steel mill, the Sanming chemical plant, the No 2 Fuzhou chemical plant, and other major factories; and accelerate construction of key projects such as the Shunchang cement works. 2) We must vigorously increase production of consumer goods that are readily marketable so as to meet the people's ever increasing demands. We must effectively restrict the production of goods which are in full or excessive supply, and guard against duplicate construction projects. 3) We must adopt effective measures to enlarge our capabilities in producing export merchandise and developing new products. While continuously developing canned goods, tea, shoes, resin, and other high-quality products, we must also turn out more toys, jewelry, paper, ceramics, construction materials, electric motors, tungsten, tungsten products, and other products for export, and make our export-oriented manufactured goods even more competitive.

Hu Ping said: Energy and communications are prerequisites in developing the national economy and the foundation in preparing for sustained future development. In the draft plan, we have given top priority to developing energy production, communications, and construction and striven to attain an even more rapid progress.

SICHUAN GOVERNMENT URGES INDUSTRIAL PRODUCTION

HK051104 Chengdu Sichuan Provincial Service in Mandarin 0930 GMT 4 Jun 86

[Excerpts] The provincial people's government has put forward specific demands on our province's industrial production in June. It is necessary firmly to grasp the golden season of industrial production, to take measures, to make sustained and redoubled efforts, and to do well in grasping industrial production in June.

In view of this, the provincial government has demanded that all places, departments, and enterprises seriously do well the following aspects of work:

1. It is necessary to clearly understand the situation, to heighten understanding, to determine the target of struggle, and to formulate measures for production. We must see the favorable conditons that supply of hydroelectricity has increased, floating capital [words indistinct] and producduction has increased. We must also see that the speed of increase in our province's industrial production is still slower than the national average and the tasks for June and the second half of this year are very arduous. We must by no means lower our guard. We just race against time, make up past deficiencies and strive to overfulfill our production quotas.

2. It is essential to do well in grasping the implementation of all policies. The provincial government and relevant departments at the provincial level have recently formulated and issued some policies and regulations on the promotion of reform and production. All places must seriously disseminate and implement them. Of these, the main ones are the enterprises' system of economic responsibility, the system of factory director assuming some responsibility, and the system of factory director assuming responsibility for the fulfillment of the quota during his tenure of office. We must really delegate to enterprises the power that should be given to them.

3. It is imperative to grasp the quality of products and to raise economic results. The quality of some industrial products of our province has dropped. Relevant departments have recently supervised the quality of some 400 products, nearly half of which do not meet the standard. The attention of relevant departments and enterprises must be drawn to this. Enterprises whose products do not meet the standard must carry out consolidation in a specified period. They must take effective measures to improve quality as soon as possible.

4. It is necessary to do well in grasping the production and supply of energy.

All production enterprises must be strict with use of electricity in a planned way in accordance with regulations.

5. It is essential to do well in the sale of products.

All enterprises must work hard to readjust product mix, improve the quality of products, and increase varities so as to make products marketable, to increase competitive ability, and to expand market. We must free the circulation channels and encourage supply and marketing personnel to vigorously promote the sale of products.

The provincial government has demanded that all places seriously pay attention to safety in production and implement the principle of safety first.

NEI MONGGOL HOLDS TELEPHONE CONFERENCE ON PRODUCTION STATUS

SK081340 Hohhot Nei Monggol Regional Service in Mandarin 2200 GMT 7 Jun 86

[Excerpts] On the evening of 7 June, the regional people's government held a telephone conference to sum up the production situation of the industrial and communications fronts in the first 5 months of this year. Liu Zuohui, vice chairman of the regional people's government, presided over and made a speech at the conference.

He said: In the first 5 months of this year, our region's industrial and communications production continued to increase in a sustained, steady, and coordinated manner. The industrial enterprises set a record with regard to the amount of profits and taxes handed over to the higher levels. Thus, the region's revenue in the first 5 months of this year increased by a big margin. The region's total industrial output value increased by 3.1 percent over the corresponding period of last year. The industrial growth rate placed the region in a higher ranking in the country.

The conference made arrangements for the industrial and communications production in the latter half of this year. In the latter half of this year, the industrial and communications front should focus its work on enhancing the vitality of large and medium-sized enterprises; further carrying out the principle of consolidation, digestion, supplementation, and improvement; delegating power to chemical industrial enterprises and streamlining their administrative procedures; and developing lateral economic cooperation. Enterprises should be supported in solving the problem concerning the lack of floating funds, upgrade product quality, vigorously increase the production of readily marketable products to meet the demands of markets, and [words indistinct].

CIVILIAN PRODUCTS FROM DEFENSE INDUSTRIES--According to JIEFANGJUN BAO, our country's scientific and technological units and industrial enterprises for national defense have gradually evolved from primarily producers of military hardware into producers of a wide range of military-civilian products. The output value of civilian products by the national defense industry has come close to half of the gross output value. [Text] [Beijing Domestic Service in Mandarin 2130 GMT 2 Jun 86 OW] /6091

SHAANXI BOOSTS INDUSTRIAL PERFORMANCE--Shaanxi set a new monthly record for industrial output in May. The provincial government has issued a notice demanding that all areas and departments concerned get a good grasp of production in the last 7 months of the year. Last month, the province's prefectures, cities, industrial departments and bureaus, and the departments concerned closely coordinated with and supported each other in creating conditions for the enterprises to increase output. The industrial growth rate increased and there was a marked improvement in economic results. Total output value was 6.3 percent up on April and 4.9 percent up on May 1985. Profit and tax handed over to the state rose by 11.1 percent compared with May 1985. The provincial government's notice demands that all prefectures, cities, and departments persevere in reform and take effective measures to ensure the fulfillment of the industrial production targets for the first half of the year. They should also get a good grasp of producing goods needed in the markets and completing key capital construction and technological transformation projects that are about to go into production, so as to increase the reserve strength for production in the second half of the year. The notice also demands strengthening of control and statistical work in production. The role of statistical work in production policymaking should be brought into full play. GUANGDONG INCREASES INVESTMENT IN CONSTRUCTION

HK240602 Hong Kong ZHONGGUO XINWEN SHE in Chinese 1253 GMT 22 May 86

[Report: "Guangdong To Increase Investment in Key Construction Projects by More Than 60 Percent This Year"--ZHONGGUO XINWEN SHE headline]

[Text] Guangzhou, 22 May (ZHONGGUO XINWEN SHE)--Guangdong Province this year will conduct 37 key construction projects, and the total amount of investments in these projects increases by more than 60 percent over last year.

Guangdong's investment in key construction projects this year amounts to 2.22 billion yuan; last year's figure was some 1.3 billion yuan.

The responsible person of the Guangdong provincial commission for capital construction said: This year, Guangdong Province will speed up construction in the energy industry, transport, and telecommunications. There are 25 key construction projects in these fields, and they involve 1.86 billion yuan of investment, which accounts for 84 percent of the province's total investment.

Among Guangdong's key construction projects this year, 15 are new projects, and the rest are old projects left from last year. The major new projects include Yangpu Harbor on Hainan Island, the Haikou power plant, rebuilding the Huangpu power plant to a coal-fueled plant, building transformer equipment at the Shajia power station, expansion of the Shatou airport, and the high road in the eastern part of Guangzhou city.

Some of the old projects that will be continued this year will be completed and put into operation. The province will increase electricity generation capacity by 215,000 kilowatts and will build 178 kilometers of new railways and 121 kilometers of new transmission lines. In addition, the Xiji coal dock in Huangpu Harbor which has a handling capacity of 4 million tons a year, the 8,000-line program-controlled telephone exchange in Guangzhou, the 20,000-line program-controlled telephone exchange and the 720-line long-distance telephone exchange in Zhuhai city and the Dongshan bridge in Meixian will all be put into use this year.

CONSTRUCTION

GUANGXI TO PROMOTE WATERWAY CONSTRUCTION

HK091539 Nanning Guangxi Regional Service in Mandarin 1000 GMT 8 Jun 86

[Excerpts] It has been learned from the recent regional conference on waterway work that waterway construction in our region during the Sixth 5-Year Plan period developed relatively greatly and that the prospects for waterway construction during the Seventh 5-Year Plan period are brilliant.

During the Sixth 5-Year Plan period, our region laid stress on harnessing 27 dangerous shoals of the You Jiang, Yu Jiang, Xun Jiang, Xi Jiang, Liu Jiang, and Qian Jiang; completed the work of dredging some 114,000 cubic meters of sand and stones; blew up some 70,000 cubic meters of reefs; cleared some 9,700 cubic meters of residue; built some 31,900 cubic meters of embankments, and maintained some 20,000 cubic meters of banks. At the same time, our region also harnessed some dangerous shoals along its tributaries, including the Zuo Jiang, Rong Jiang, Yong Jiang, He Jiang, and Nanliu Jiang. The completion of this work has played an important part in promoting Guangxi's water transport.

During the Seventh 5-Year Plan period, our region will lay stress on the construction of the Xi Jiang shipping transport facilities, basically complete the Guiping's shipping [words indistinct], harness the waterway from Guixian County to Wuzhou, complete the initial period of construction of Guixian County's shipping [words indistinct], complete the work of harnessing the Li Jiang and dredging 840 km of inland waterways, harness the tributaries, including the He Jiang, Zuo Jiang, and You Jiang, and vigorously demolish some dams which obstruct the waterways. In the Nanning waterway region, it is necessary to solve the bottleneck problem at the waterway section from Xijin to Guixian County. The 107-km low-water waterway from Xijin to Guixian County will increase from 0.9 m to 1.2 m. At the You Jiang, it is essential to lay stress on harnessing three shoals, including (Sanmen), (Naban), and (Jiadaowang). In the Liuzhou waterway region, it is imperative to mainly harness two shoals, (Dashen) and (Zhuantong), and at the (Lema) waterway section of the Qian Jiang.

With regard to maintaining the navigation marks, we must strive to use solar energy navigation mark lights at all navigation marks on the 567.5 km of waterways from Nanning to Wuzhou and along the coasts. In 5 years, we must increase electric navigation mark lights by 550 so that the total number of electric navigation mark lights reaches 1,528.

At the same time, VHF wireless telephone will be used on the entire line from Nanning to Wuzhou, from Guilin to Yangshuo, and along the coasts and a wireless telecommunications network will be established so that information about safe navigation can be promptly supplied to ships.

WATER RESERVOIR PROJECT--A huge project for the development of freshwater resources in China's coastal areas--the water diversion project along the Changjiang at the Baoshan steel complex--was completed on 27 May. When Chen Yun, Standing Committee member of the Political Bureau of the CPC Central Committee and first secretary of the Central Discipline Inspection Commission, conducted an inspection tour of the Baoshan steel complex, he named the water reservoir of the water diversion project "Baoshan Lake" and wrote an inscription for it. Before it went through a test run, the water-diversion project had withstood tests by many strong typhoons and shifting tides. After its test run, it once again withstood a water drainage test during the dry season. The water drainage system has proven to be effective, and the quality of the project, excellent. FOREIGN TRADE AND INVESTMENT

UTILIZATION OF FOREIGN CAPITAL IN GUANGDONG DISCUSSED

Beijing GUOJI MAOYI WENTI [INTERNATIONAL TRADE JOURNAL] in Chinese No 1, Jan-Feb 86 pp 5-11

[Article by Qui Shunping [8002 5293 1627]: "Policy Measures for Utilization of Foreign Capital in Guangdong to Import Technology"]

[Excerpts] Policies are the codes of conduct. Under a system that stresses macroeconomic control, correct macroscopic policies are especially important for reviving the economy. In recent years, the national economy of Guangdong has developed at an annual growth rate of 10 percent and within only a few years a new era in opening up to the outside world has been ushered in. The tremendous strength of the state's "special policies and flexible measures" which have been implemented in Guangdong has been demonstrated. Over the past few years, although Guangdong has gained critical advances in the utilization of foreign capital to import technology and has taken the lead nationally, nevertheless, various inadequacies still exist. Under such circumstances, going back over policy work in the utilization of foreign capital and looking ahead are both beneficial to further promoting the utilization of foreign capital in Guangdong to import technology. This may also provide lessons for other regions on work in this area.

II. Policy Measures for Ushering in a New Era in the Utilization of Foreign Capital in Guangdong To Import Technology

An open door policy will not act as an obstacle to historical trends and the utilization of foreign capital to import technology is a natural result of opening up to the outside world. These past few years Guangdong has obtained great successes in utilizing foreign capital to import technology. At the same time, there have been numerous problems. We must not stand still and refuse to make progress nor should we hesitate to press forward. We must expand further both horizontally and vertically and strive to usher in a new era. We must push the utilization of foreign capital in Guangdong to its limits and march to new heights. The preliminary phase of foreign capital utilization in Guangdong is already coming to an end and the newly developing phase is about to unfold. What should the new tactics be for Guangdong's utilization of foreign capital to import technology during the transition period between the two phases? Below I will discuss several of my opinions.

1. Establish sound rules and regulations for the utilization of foreign capital to import technology and overcome the phenomena of beggars being unable to be choosers in the utilization of foreign capital and deviation from strategic objectives.

It should be noted that during the past few years of utilizing foreign capital to import technology the phenomena of beggars not being choosers and deviating from strategic objectives have been quite widespread and severe. The utilization of foreign capital to import technology should involve orderly actions as well as effective measures for guiding and controlling these actions, that is, a sound system of rules and regulations. China's strategic objective in the utilization of foreign capital to import technology is clear. It is to fully utilize all international economic and technological forces by means of developing foreign economic and technological exchange and cooperation to serve socialist modernization and strengthen China's self-reliance. The realization of this general goal is a long-term task, it cannot be attained in one day. During this period there must be certain goals for each period and separate goals which function as guarantees. This requires that we focus on these goals and consider and formulate procedures for utilizing foreign capital so that this system of rules and regulations becomes standard conduct in the utilization of foreign capital to import technology. The rules and regulations currently in effect are not sufficiently clear and specific and there are loopholes. For instance, in the utilization of foreign capital to import technology, provisions do not clearly specify what may enjoy preferential treatment or what should be restricted. Many policy provisions lack feasibility studies or detailed rules for implementation. Thus many policy provisions are either difficult to really implement or are exploited by some people due to unclear policy limits.

In order to strengthen the political effectiveness of the rules and regulations, concerned departments should unite and assign a specific number of personnel to straighten out the regulations for the utilization of foreign capital to import technology. On this basis, they should review the past few years of actual experience and revise, supplement, perfect, and develop regulations for utilizing foreign capital to import technology. This is fundamental and important task for ushering in a new era in the utilization of foreign capital. In order to carry out this task even more successfully, it is necessary to do the following: (1) While expanding local, departmental and enterprise autonomy in determining policies regarding the use of foreign capital to import technology, it is necessary to strengthen the unified control of policymaking criteria and gradually make policymaking more scientific and standardized. Macroeconomic control departments should strictly ensure policymaking criteria by means of the various regulations. (2) It is necessary to carry out thorough feasibility studies of all policy provisions and ensure that all policy provisions are genuinely enforceable. (3) All policy provisions should have corresponding enforcement provisions. Guangdong should take the first step in opening up to the outside world be met. Moreover, in order to ensure that the introduction of technology is even more geared to our needs it is necessary to conduct a survey or sampling investigation on the state of industrial technology so as to find the weak links in the domestic supply and demand of technology. It is necessary to apply network theory, give priority to strengthening the weak links, implement special preferential policies for import projects that can strengthen the weak links, and establish an open industrial zone or an open technology network.

2. While carrying out policies that ensure foreign exchange balance throughout the country as a whole, we may allow policies that bring about an imbalance in the foreign exchange system in parts of the country. We will still carry out an improvement in the overall foreign exchange balance.

In terms of the long-range overall situation, when utilizing foreign exchange to import technology it is generally necessary to scrupulously abide by the principle of having a balance of foreign exchange, otherwise there is the danger that the foreign debt will become too heavy and it will have to be restricted or controlled. It is extremely important to ensure having a rational foreign debt. Excessive conservatism may affect the scope and rate of the absorption and use of foreign capital. If the debt is too great it will eat up a large amount of export revenues or gold reserves.

In sum, when dealing with the balance of foreign exchange on a macroeconomic level it is necessary to avoid being one-sided. We must have the concept of viewing the situation as a dynamic whole and we must implement the principle of balancing the whole system. The central ideas of this principle are: in balancing foreign exchange, break through local, departmental, occupational, enterprise and time limitations; demand that every part conform to the principles of mutual compensation in the balance and utilization of foreign exchange; oppose each one fighting for his (own) position and everyone shifting responsibility on others; strive to improve the unified balance, distribution, and use of foreign exchange; and ensure the integrated and favorable balance of foreign exchange.

3. Increase demand for bringing in exchange in the utilization of technology, expand preferential treatment for prototype technology, establish the coordinated introduction of models which correspond to Guangdong's ability to bring in foreign exchange and the direction of technical development in Guangdong.

At present conditions in Guangdong relating to the utilization of foreign capital to import technology are as follows: (1) Both in terms of economic geography and macroeconomic policies, Guangdong has the superiority and ability to develop the use of foreign capital to import technology on quite a large scale. (2) Although Guangdong already has some ability to bring in foreign exchange, compared with foreign exchange demands, this ability is still quite inadequate. Moreover, the structure of this ability is quite backward, because it relies primarily on exchange from agricultural byproducts, semiprocessed products, and compensation trade. (3) The Central Committee has asked Guangdong to take the lead in opening up to the outside world, to become a window to the outside world, to spread advanced technology and management from all over the world, and to increase exchange for the nation. Guangdong, thus, is confronted with two great tasks in the use of foreign capital to introduce technology. One is that it is necessary to absorb as much advanced practical technology as possible and management experiences which correspond to national conditions in China so as to facilitate spreading them throughout the country. Thus, during

Guangdong's utilization of foreign capital to introduce technology, it is necessary to develop a relatively strong capacity to exploit technology.

In order to ensure the realization of the two aforementioned tasks, Guangdong must use a new pattern of importation and head along the combined path of creating exchange and exploiting technology. The basic features of such a pattern of importation are as follows. It is possible to decrease, as appropriate, technological standard requirements for projects that have a strong capacity for generating exchange. The primary basis for determining whether preferential treatment be given is whether or not they can generate more exchange. Such projects should give priority to being geared to exports. They may also replace imports. They must be competitive on the international market or be able to bring in foreign exchange. It is possible to relax requirements for bringing in exchange for projects that have a strong ability to exploit technology. The primary basis for determining whether preferential treatment be given is whether they spread advanced practical technology throughout the country. Such projects must give priority to spreading technology. Similarly, they can also replace imports. The former type of project stresses direct beneficial results and requires that we have a foreign exchange compensation balance; the latter type of project stresses indirect beneficial results and the foreign exchange spent may be compensated by using other foreign exchange revenue.

4. Under the premise of strengthening domestic investments, it is necessary to break through limitations among departments, regions and enterprises, to form enterprise groups and to promote the study, absorption, mastery, improvement, development, and transfer of imported technology.

In order to give full play to the benefits of imported technology, it is necessary to improve the study, absorption, mastery, improvement, development, and transfer of imported technology. This is the generally recognized experience at home and abroad. Nevertheless, in our province, work in these links has been quite poor from beginning to end. Thus, we should rationally arrange investment ratios for each link in investment planning and have domestic and foreign capital investments as well as investments in each link. In terms of organization, we should adopt policies to encourage and foster cooperation across regions, departments, and businesses and encourage the integration of the entire process of work in importing technology by developing enterprise groups.

In addition, in order to accelerate the transfer and spread of the fruits of imported technology, under the premise of not violating special-interest laws and according to the requirements of regulations for a commodity economy, it is necessary to encourage the commericialization of the fruits of imported technology and to give full play to the role of the technology market. It is also necessary to open up exchange channels for the successful results of imported technology, to arouse the initiative of units involved in importing technology, to transfer and spread successful results, and to ensure that the rational interests of these units not be infringed upon.

5. Determine the scope of feasibility studies for projects involving imported business technology and provide unified criteria for examining and approving projects which are genuinely enforceable and can function as checks.

Although there are problems in extending autonomy in the utilization of foreign capital to import technology, macroeconomic management departments must not be indifferent. On the contrary, in macroeconomic terms, they must strictly check on what is allowed or not allowed to be imported or what imports are to be encouraged or restricted. However, the implementation of such checks must not depend on subjective will but rather on scientific criteria for examination and approval. Feasibility studies must be made on the utilization of foreign capital to import technology. The results of these studies form the major basis for macroeconomic control departments in appraising import projects.

6. Improve research on the international money market and the technology market, develop cooperation among the various currencies, and practice the tactics introduced by multilateral organizations for stimulating customer competition.

At present, one of Guangdong's problems in the use of foreign capital to import technology is that there are too many unitary clients and they are highly concentrated in specific regions and countries. For example, in 1983 the sources of investment capital in foreign capital enterprises in Guangdong were highly concentrated in Hong Kong and Macao. The total amount of investments of businessmen in this region amounted to 420 million yuan, or 91.5 percent of the total amount of investments. The amounts in other countries were: 20.87 million yuan in the United States; 7.51 million yuan in England; 6.72 million yuan in Southeast Asian countries (Singapore, Thailand); 1.93 million yuan in Japan; 820,000 yuan in Norway; 420,000 yuan in the FRG; and 120,000 yuan in Switzerland. If clients are excessively concentrated, it is disadvantageous to China in reaping a profit from competition. On the contrary, it may lead to our being dependent on clients.

There is also a problem of buyer's and seller's markets involved in the utilization of foreign capital to import technology. We must realize that while we hope that foreign businesses will come forward to make investments, foreign businesses are also eager to seek outlets for investment. If we only think of how urgently we need to import and overlook how the other party urgently needs to export, then we may consciously or unconsciously enter into a seller's market. This would mean giving up the power of initiative we may have gained and this would give rise to importation that is oriented toward the seller. As for utilizing the international money market and technology market, in order to strive for even greater power of initiative, it is necessary to improve market research in this area so as to understand market dynamics and thereby come up with corresponding countermeasures.

At the same time, the work involved in having dealings with numerous clients compared to unitary clients is undoubtedly more difficult to carry out, but the import results are more ideal. One is that it is advantageous to each party to learn from the other's strong points to offset their weaknesses and to obtain what we need. The other is that competition among nations benefits our side at the conference table when negotiating terms and bargaining.

Countries such as Japan, an industrially developed nation, are still practicing these tactics. There experiences have shown that they are effective. One point is worth noting, namely, when practicing such tactics it is even more necessary to get good client credit information, for if a certain client does not honor credit obligations, it may affect our overall planning arrangements. At present, work on client credit information is still quite poor. It is necessary to improve work in this area along with further development of foreign economic and technological cooperation.

SPECIAL ECONOMIC ZONES

SHENZHEN DEVELOPMENT STRATEGIES OUTLINED

Guangzhou GANGAO JINGJI [HONG KONG & MACAO ECONOMIC DIGEST] in Chinese No 8 25 Aug 86 pp 38-42

[Article by Li Yizhong [2621 5030 0022] of the Shenzhen SEZ Development Co: "Shenzhen Should Be Built Into an Urban Center for Direct Economic and Technical Exchange With Foreign Countries; an Inquiry Into Development Strategies and Guiding Principles for the Shenzhen SEZ"]

[Text] The guiding ideology behind the slogan, "New and special methods for new and special things; keep our standpoint unchanged while completely renewing methods" should be implemented in the construction of the Shenzhen SEZ. We should free ourselves of traditional urban construction forms, make full use of our own unique advantages and build Shenzhen into an urban center (or bridge) for direct economic and technical exchange with the outside world.

The Lack of Effectiveness of Traditional Urban Construction Models

Current construction in Shenzhen is generally based on the usual urban construction models used both here and abroad. Because of this, the objective for construction can only be to build Shenzhen into an ordinary industrial city and port for commerce and foreign trade. Recently it has been suggested that Shenzhen be built into a comprehensive outward-facing special economic zone, with an equal emphasis on industry and foreign trade, particularly industry, characterized by an integration between technology, industry and foreign trade. However, this concept still remains within the bounds of the traditional city model, and is not fully integrated with the practical situation and conditions in China and in Shenzhen. If, when deciding upon guiding principles, we become divorced from the needs of China's four modernizations, from local natural resources, from the geographical environment, and from the original foundation and potential for development, we shall only get half the desired result while exerting twice the effort. The reasons for this are:

First, to develop industry, especially the "doubly concentrated" industries, requires the existence of fairly complete basic industry, suitable and abundant raw materials and high-level scientific and technological personnel and institutions. But these conditions are exactly what Shenzhen is weak in. Of course, as pioneers, we ought to have the pioneering spirit and create conditions where they are lacking, but to create the above conditions requires time, investment and many other factors for which a large price must be paid, and noteworthy results will not be forthcoming for some time. Everyone is seeking to develop in the directionof the 14 open coastal cities. But these cities all have the necessary basic conditions, especially Shanghai, Tianjin, Dalian, Guangzhou and other older industrial cities. How can Shenzhen compete with them? And appraising the problem from the point of view of regarding the entire country as a chessboard, what good is there in duplicating many industrial projects?

Second, the construction of a foreign trade port requires, first of all, building a harbor and piers that can handle a large volume of goods. It also requires railroads and the organizing of an international fleet, installing more telecommunications equipment, and building international finance and information institutions. More important is the possession of one's own export commodity base, channels for international and domestic trade, etc. In this, Shenzhen cannot compare with Shanghai, Tianjin, Dalian, or Guangzhou. Furthermore, Hong Kong, one of the largest foreign trade ports in the world, will again be a part of China. Therefore, careful thought should be given to plans for building Shenzhen into a port for international trade like Hong Kong, Shanghai, Guangzhou, Tianjin, or Dalian.

Third, in developing outward-facing industry, overseas sales of products are of primary importance, which is in direct conflict with the major aim of foreign investors in China--the winning of Chinese markets. Quite a few large financial groups and entrepreneurs come here to negotiate investment with just this aim in mind, but often fail to achieve success because of the orientation of product sales. Therefore, to this day Shenzhen has not attracted many large consortiums or initiated any large-scale projects. Part of all of the products of some foreign investors in China (most of whom represent medium- or large-scale enterprises), could be sold abroad. But they all wish to select locations that provide land, labor, inexpensive raw materials, a fairly good technology, and preferential treatment for their investments. Juding from present conditions, Guangzhou, the Zau Jiang delta and otheropen cities have numerous advantages in this over Shenzhen, and there is fierce competition among them. Quite a few projects originally discussed in Shenzhen have since been shifted to the interior. Some enterprises in the SEZ have rushed to set up bases beyond the second border. This is a reflection of their lack of confidence in constructing outward-facing enterprises in the Shenzhen SEZ, and is a development that must be dealt with.

The purpose of establishing SEZ's is to utilize the special geographic conditions within the zones to implement preferential policies and flexible measures in order to promote economic and technical exchange with foreign countries, make full use of the "four windows" and serve the four modernizations. If Shenzhen is built according to the usual urban construction models without taking its unique characteristics and competitive capacity into consideration, not only will a great deal of human, financial and material resources have to be spent, but the objectives of construction the SEZ's themselves may not be achieved.

Make Full Use of Shenzhen's Greatest Advantages

To build Shenzhen into a city with unique functions and competitive abilities requires first making full use of its greatest advantages. What are Shenzhen's greatest advantages? Its close proximity to Hong Kong and the International market make it one of the most important ports in the world. A city's geographical position is often one of the most central factors in its successful construction. Hong Kong used to be a poor, isolated island with no natural resources or industry, but it had an extremely advantageous geographical position. With the vast, populous and potentially rich Chinese mainland at its back, Hong Kong got a stranglehold on transportation in the South Pacific. In addition, the implementation of appropriate policies and measures helped it to develop in a short period of time into an international finance, foreign trade, communications and shipping center. After his visit last year to various large cities in China, the well-known economist from Columbia University in the United States, Dr Wang Nianzu [3769 1819 4371] told this reporter: "The investment environment of Shenzhen should be linked up with Hong Kong. The two cities are separated only by a river, which makes for convenient transportation. Hong Kong's advantages are also, in fact, Shenzhen's." This shows great practical insight and judgment. In fact, many foreign businessmen who invest in or have established offices in Shenzhen are of the same mind.

International economic and technical exchange (including investment, credit, setting up industries, developing commerce and trade, technological cooperation and transfer rights, etc.), usually takes on one of two forms: the direct form in which both parties meet face to face and negotiate and come to an agreement on the spot; and the indirect form in which documents, diagrams materials and samples are sent, or middlemen are used in negotiations and reaching agreements. The advantages of the first type are that there is a great deal of contact, mutual understanding is more easily achieved, the objects of negotiation can be seen in person, there is more room for choice and the success rate is fairly high. Therefore, many countries have established various large-scale international fairs (such as Germany's Leipzig and Japan's Tsukuba, and others), in order to provide excellent conditions for direct trade or technological cooperation with foreign firms of all nations. Foreign enterprises have also energetically established companies, branch offices or representative bureaus throughout the world in order to broaden the abovementioned first form of exchange. However, China faces many difficulties in its present attempts to expand direct importation, foreign trade and scientific cooperation. Few Chinese enterprises have branches abroad and the number of staff members who can be sent overseas on learning tours, to negotiate import contracts or to engage in trade is limited. Due to a series of problem relating to importing, customs duties and transport, there are limits on time and on the variety and quantity of goods shown in domestic fairs displaying foreign products and technology. Large numbers of foreign businessmen cannot be accommodated at export commodity fairs because of difficulties in transportation and arranging visas. Many inland enterprises have flocked to Shenzhen to open companies or offices to gain a "window" on foreign economic exchange and find a way out of their difficulties. Some enterprises in Dalian and Shenyang have not set up companies or offices in Shenzhen, and foreign businessmen find it very difficult to get to the northeast from Hong Kong, so have no alternative other than sending representatives to Shenzhen to conduct negotiations. This all shows how much China needs to create cities that can act as bridges for comprehensive and direct economic, technical and cultural exchange.

Shenzhen is without doubt the ideal choice for this role due to its proximity to Hong Kong and international markets, a unique advantage in China. First, Shenzhen is one of the largest comprehensive special zones. Foreigners, and Hong Kong and Taiwan compatriots can come and go easily, as can large numbers of personnel from the interior. Frequent economic and technical exchanges of all kinds can be carried out and the "four windows" function can be fully utilized. Due to its different social system and management practices, Hong Kong cannot take Shenzhen's place in this respect now or even for the next 12 years. Second, definite achievements have been made in various aspects of construction in Shenzhen, which has provided it with a preliminary foundation to function as a bridge to the outside. Many construction projects will become increasingly effective in the near future, while investment will be reduced corresponding. Third, many industries and departments are now carrying out various kinds of exchanges and cooperative projects in the areas of importing, foreign trade, personnel training, and other activities. As long as experiences are summed up, work is improved, and development is planned, Shenzhen can become a center for exchange of all kinds. Most noteworthy is that the establishment of such an urban bridge with its unique functions is not only not in any real conflict with the development of other open cities across the nation and Hong Kong, but is a welcome development for the entire nation due to its service to the country. It will play a giant role now and in the future in promoting the stability and reputation of Hong Kong.

Ideas on Urban Centers for Direct Exchange

In functioning as the "four windows," fanning out in two directions, and serving to improve international economic, technical, cultural and educational exchange, Shenzhen's primary strategic guiding principle should be the development of tertiary industry (including circulation and service industries), in order to mobilize the overall development of industry, scientific research, agriculture, personnel training, and other fields. The current economic system and administrative structure must be thoroughly reformed, and the following eight centers set up:

1. A center for the import and export of technology. Its main function would be to import and export technical knowledge, equipment, capital (mainly via importing; exported capital is to be used primarily for the establishment of enterprises overseas), laborers, and management knowledge, and serve as an intermediary organizer, experimenter and relayer. The center will attract firms from abroad, Hong Kong, Macao, Taiwan, and interior cities to set up companies and factories and to maintain workshops and business information services in Shenzhen. Firms (including SEZ firms), will be able to make

direct contacts, negotiate import and export contracts. It will also assist them in signing cooperative investment agreements, transferring large amounts of capital and projects to the interior. At the same time the center will assist in exporting all exportable technical equipment, products, and labor. The Shenzhen SEZ will also establish its own industrial base, and select, in its negotiations, some export-oriented projects to carry out in the SEZ, or invest in stocks and shares in the interior or abroad, thus making industry in the zone more flexible and adaptable. With strong logistical support, the SEZ can become a base for the import and export of commodities.

2. A center for scientific and technical exchange. The center would include a science and technology building, an exhibition hall, a scientific and technical information service, a science and technology market, and so on. It would have, in addition, a hotel, restaurant, entertainment, and other facilities. In order to attract foreign and domestic firms, scientific research institutes and institutions of higher education would establish various research units and special technical companies, sponsor special or overall science and technology exchange fairs and exhibitions, organize all units involved to engage in research in one or several fields, to appraise or test products, to provide scientific and technical information services for domestic and international consumption, and to contract for projects involving scientific and technical product development projects. A large-scale modern scientific exhibition center such as the one in Japan's Tsukuba could also be established.

3. An international fair and trade center. Capital could be concentrated to establish a Leipzig-style large-scale exhibition and sales center, which would include the involvement of all commercial districts of the city (exhibits could be arranged by industry), to attract foreign firms. Domestic enterprises could also set up companies, retail outlets, agent offices and so on to exhibit products made at home and abroad. Famous and specialty products from all over China and the world could be purchased here. In addition, various trading, credit, advertising, packaging, storage and shipping, customs, tax, auditing, mail order, product inspection, time consultation, and other service companies could be set up. Factories could be setup for product assembly, processing, and repairs. The trade centers should promote the integration of trade, industry and technology, as well as of production, supply, and marketing; reduce the number of middlemen, and attract foreign and domestic customers by offering a large volume of varied (foreign and Chinese) reasonably priced products. These centers would enliven the economy and allow both Chinese and foreign firms access to channels in which to market products.

4. An international information service center. The SEZ must set up its own independent information organ with modern communications equipment. At the same time, it has to attract information organizations from abroad, Hong Kong, Macao, and inland cities to set up branches in Shenzhen, to initiate long-term or temporary information markets, publish various information newspapers, and provide information services in science, technology, industry,

commerce, foreign trade, finance, construction, shipping, real estate, education, personnel and so on, so that if the interior wishes to understand information from Hong Kong, Macao, Taiwan, and foreign countries, it will need Shenzhen, and if foreign firms and other persons throughout the world wish to understand information from China, they must also go to Shenzhen.

5. A financial services center. In addition to strengthening the guiding role of several large state banks, more foreign banks must be allowed to open branches or representative offices here to run banking and financial services. Chinese and foreign banks, joint leasing companies and Chinese financial companies must be organized to expand credit, and leasing services to serve inside and outside the SEZ. An SEZ stock market could be established, and Chinese and foreign companies could be encouraged to sell their stocks there. Joint and Chinese financial information and consultative companies could be established to provide financial and market information services at home and abroad.

6. A center for the training and exchnage of personnel. First, intellectual resources and experiences from Hong Kong, foreign countries and the interior must be absorbed, and the SEZ's universities and various technical schools should be well managed in order to train specialized personnel for export-oriented work in the SEZ's and other parts of the country. Schools and scientific research, academic, commercial and trade organizations from China and overseas should set up in Shenzhen various personnel training centers and exchange organizations (such as employment agencies, training centers, specialized training classes, etc.). Academic exchange conferences should be sponsored and flexible measures taken not only to train and bring in personnel for the SEZ, but more importantly, to train and exchange personnel in international economics and technology for China, and to provide Chinese-language, economics and technical personnel for Hong Kong and foreign countries. In this way, the personnel will help spur on foreign trade activity and technology import and export.

7. An international tourism center. Not only must we do a good job in running the SEZ's tourist network and attract more foreigners and tourists from Hong Kong, Macao, and the interior to Shenzhen, but we must develop more foreign, Chinese, and joint-capital travel agencies to link up with the major Chinese tourist areas and cities abroad and organize an international tourist network. On one hand, we could organize Hong Kong and foreign tourist groups to travel in Shenzhen and the interior, while, on the other hand, we could organize inland Chinese tourist groups to travel to Shenzhen, Hong Kong, and foreign countries.

8. A transport and transportation cooperation center. While stressing the construction of railroads, highways (including high-speed parkways), ports, piers and airports, we must also seek economic links with Chinese and foreign railway, aviation, shipping and highway concerns, establish various specialty or joint shipping companies and develop diversified transport services.

In addition, as the South China Sea oilfields are successfully developed, a South China Sea development service center could be established. These centers would entail a professional division of labor, and could become semi-official organs to replace some purely official administrative organs now run by the city government, reduce governmental interference, and increase enterprise vigor. In this way, the economy can be invigorated. We must broaden our vision beyond the bounds of the SEZ to include the entire country and the world, and service the cause of economic, technological, cultural, and educational exchange between China and abroad. The above eight centers would be established for just these services, and would be primarily guided by the development of tertiary industry. The experiences of various countries worldwide demonstrates that tertiary industry requires less investment time and reaps higher rewards. It is also the liveliest and most profitable industry. If larger numbers of people can be attracted every year to Shenzhen to engage in exchanges of various kinds and to travel, the SEZ will flourish and prosper and will bring in a considerable amount of foreign currency.

More Flexible Measures Must Be Implemented

The key to the implementation of the above ideas lies in uniting our understanding, further liberating our thinking, really implementing the open door policy and taking more flexible measures.

1. Policies of preferential treatment more favorable than in Hong Kong and the interior must be implemented. The "two borders" must rapidly develop to turn Shenzhen into a genuine favorable tax-rate district. In particular, strenuous measures must be taken to eliminate various illegal sources of "tax revenue" (various exorbitant taxes and levies and additional fees and charges). Effective steps must be taken to lower land, factory building, and market prices and rents, to reduce the price of labor, increase productivity, and attract more foreign businessmen to invest and cooperate in Shenzhen.

2. Channels of all kinds both here and abroad must be created. The various centers and major enterprises must establish branch offices in major cities abroad and nationwide, and set up vast information, financial, trading, and transportation networks.

3. Entry and exit to and from the SEZ must be made more convenient. The number of people who enter the SEZ will determine its success and prosperity. The zone should be opened more to the outside, and measures should be taken to make entry and exit to and from the zone simpler and more convenient for personnel of all types at any time.

4. Foreign exchange management in the SEZ must be liberalized, and currency for use within the zone must be issued to encourage the development of direct trade.

In short, we must implement the guiding thinking of Comrade Deng Xiaoping regarding the SEZ: "It should be freed, and not hampered." We must constantly study and resolve problems that appear during the practice of construction and improve and enliven our work. The Shenzhen SEZ will surely become more prosperous and flourishing and contribute even more to the country's four modernizations.

HEBEI MEETING OF MODEL WORKERS REPRESENTATIVES CONCLUDES

SK091002 Shijiazhuang HEBEI RIBAO in Chinese 24 May 86 p 1

[Excerpts] The provincial meeting of representatives of model workers and advanced collectives concluded today after a 3-day session.

During the meeting, the representatives conscientiously listened to, studied, and discussed the reports given by Comrades Xie Feng and Zhang Fuyou. Twelve comrades, including Song Guangming and Wu Shuzhen, gave an account of their advanced experiences and exemplary deeds. Seven comrades submitted written reports.

Attending the closing ceremony were leading comrades of the provincial CPC Committee, the provincial Advisory Commission, the provincial People's Congress Standing Committee, the provincial government, the provincial CPPCC Committee, and the provincial Discipline Inspection Commission, including Xie Feng, Li Wenshan, Yang Zejiang, Ye Liansong, Lu Chuanzan, Qu Weizhen, Bai Shi, Wang Zuwu, Zhang Runshen, Song Shuhua, Wang Yu, and Xu Chunxing, as well as responsible comrades of the provincial Trade Union Council, the provincial CYL Committee, and the provincial Women's Federation.

Zhang Fuyou, secretary of the Secretariat of the All-China Federation of Trade Unions, also attended the closing ceremony.

Vice Governor Song Shuhua presided over today's meeting. Leading comrades of the province presented silk banners and certificates of citation to 120 advanced units and collectives and medals and certificates of citation to 504 model workers, as well as medals and certificates of citation to 41 comrades who won this year's "1 May" labor medals given by the All-China Federation of Trade Unions.

Ye Liansong, member of the Standing Committee of the provincial CPC Committee and vice governor, gave a speech. He expressed the hope that the participants, after returning to their own places, would apply the advanced ideology and experiences they have studied to the great practice of reform and construction, strive to create more outstanding achievements, win greater honor, and work together with the people throughout the province to fulfill or overfulfill the province's 1986 economic and social development plan, to successfully accomplish the Seventh 5-Year Plan, and to achieve a splendid future.

LABOR AND WAGES

BRIEFS

WORKERS ON AID PROJECTS--Beijing, June 8 (XINHUA)--The State Council has issued commemorative certificates to 19,450 builders who have been dispatched to work on 43 aid projects in Tibet by 9 Chinese provinces or municipalities and some ministries, according to today's PEOPLE'S DAILY. These projects were undertaken in Tibet in line with directives of the party Central Committee and the State Council. About 20,000 people from Beijing, Tianjin, Shanghai, Jiangsu, Zhejiang, Shandong, Sichuan, Guangdong and Fujian and the ministries of machine-building, water resources and electric power, and agriculture, animal husbandry and fisheries participated in the construction. Except for three projects suspended because of readjustments in construction designs, 40 had been completed and put to use at the end of last year after only 1 year of construction. The State Council decided to issue certificates to the builders working on these projects, including those in geological prospecting, designing, construction and management, the paper says. POPULATION

SURVEY SHOWS PROGRESS OF CHINA'S FAMILY PLANNING WORK

Beijing RENKOU YU JINGJI [POPULATION AND ECONOMICS] in Chinese Vol 1, 25 Feb 86 pp 28-34

[Article by Yang Qingtao [2799 3237 3447] of the Beijing Economics College Population Economics Research Institute and Yang Zihui [2700 1311 1979] of the Chinese Academy of Social Sciences Population Research Institute: "A View of the Great Achievements of Chinese Family Planning as Shown in the One One-Thousandth Sampling Survey of the Population"]

[Text] The great success of Chinese family planning during the 1970's has drawn the attention of the entire world. People are not only following Chinese developments but are trying to learn from them. Therefore painstaking, thorough and scientifically correct analyses and research on the achievements and development of China's family planning are most important. The "One One-Thousandth Population Fertility Sampling Survey" carried out in 1982 by the State Family Planning Commission provides abundant and accurate data for analysis and research. This article is a preliminary exploration of China's family planning based on this data.

I. Changes in the Age of Women at First Marriage

Under ordinary circumstances, marriage comes before giving birth, and giving birth is the natural result of marriage. Thus, the age of women at their first marriage is an important indicator used for studying changes in the fertility of women and in the fertility of the population. It is also one of the principal indicators of the achievements of China's family planning. The one one-thousandth fertility sampling survey data shows that the age at first marriage of Chinese women changed considerably during the 33 years from 1949 through 1982. It has these three characteristics:

1. The average age of women at their first marriage rose considerably. (See Figure 1)

In 1949, the national average age of women at their first marriage was 18.57 years. By 1960, it had risen to 19.57 years and then rose again to 23.05 years by 1980 before declining slightly to 22.82 years in 1981. This development can be divided into two periods with the years 1949 through 1970 comprising the first period. During the 22 years of the first period due to the

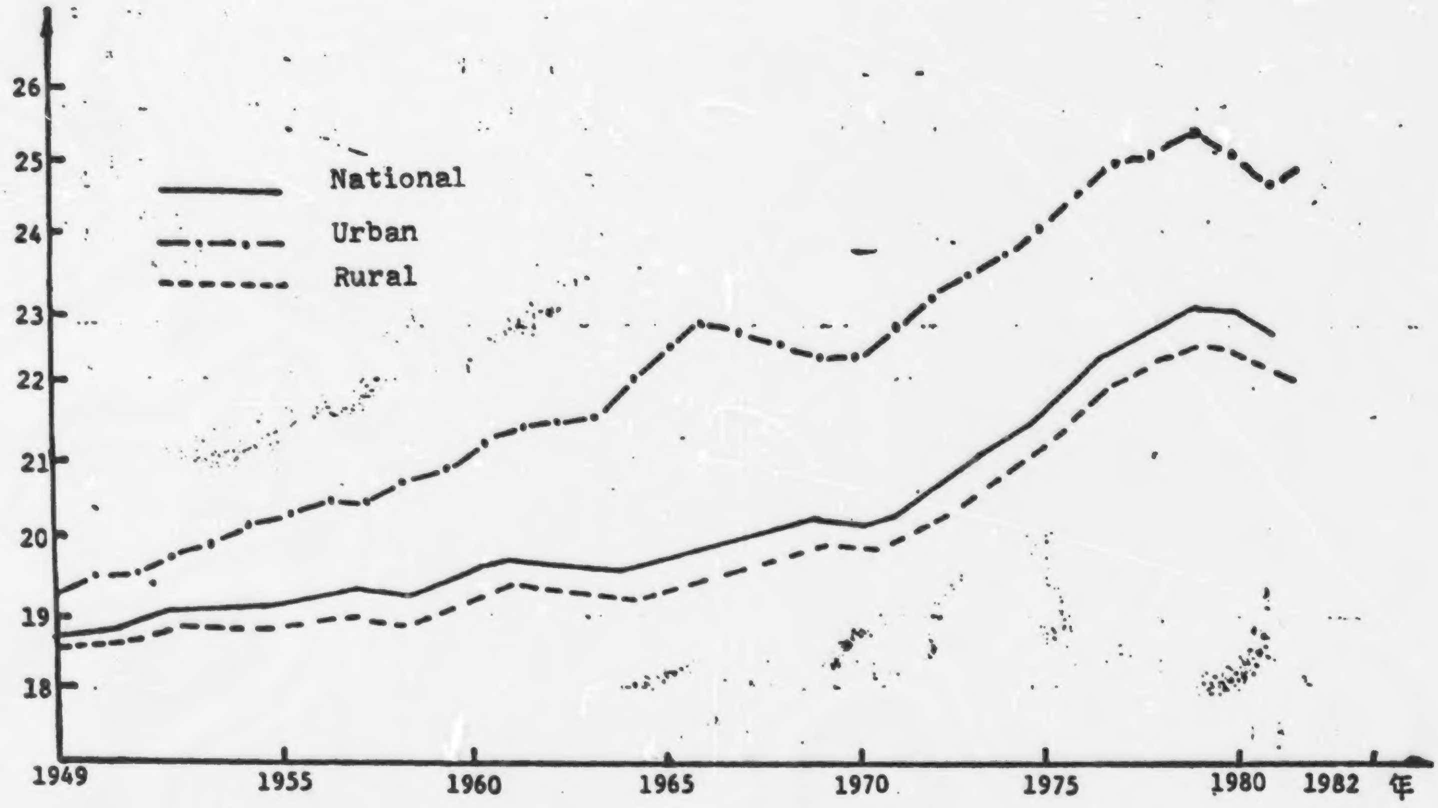

Figure 1. Average Age of Females at Their First Marriage
(1949 Through First Half of 1982)

promulgation of the "Marriage Law" there was a great change in the custom of early marriage. The average age of women at their first marriage climbed in a gently rising curve with many fluctuations. This is related to contemporaneous changes in the social and political situation.

The second period extends from 1971 through 1981. Although this period is just half as long as the first period, the average age of women at their first marriage climbed twice as fast, as can be seen from the steep, almost vertical, slope of the curve. The energetic promotion of family planning beginning in the 1970's clearly accounts for this. A decline in the average age of women at their first marriage began in 1980 and had fallen to 22.66 years of age by the first half of 1982. This is certainly related to the relaxation of late marriage propaganda since the promulgation of the new "Marriage Law." Yet this temporary decline cannot affect the general trend of steady increases in average age of women at their first marriage.

We can see in Figure 1 that trends in the average age of women at their first marriage among both urban and rural women are generally consistent although a fairly large gap which exists between the villages and the cities and townships shows that the rural villages still have not fully realized their potential for increasing the average age of women when they marry for the first time.

2. The rate of women marrying for the first time at a late age has also greatly increased. (See Figure 2)

Defining marrying late as marrying after 23 years of age as urged by Chinese national policy, the proportion of women marrying late was 6.6 percent in 1949, increasing to 13.8 percent by 1970 and again to 52.8 percent in 1980. Analyzing these trends, we discover that the curves for women's late marriage rate and the average age of women at first marriage are very similar. Even the difference between the rural and the urban rates is very similar to these curves. Before 1970, the rate of increase climbed slowly in a fluctuating and nearly flat curve. After 1970, the rate increased very rapidly with a steep, straight and nearly vertical curve. After 1980, a decline began which was related to the promulgation of the new "Marriage Law." Certainly the very rapid increase in late marriages since the 1970's resulted from the effectiveness of the vigorous dissemination of propaganda promoting late marriage.

3. The rate of women marrying early has declined considerably. (See Figure 3)

Taking the lowest legally permissible age for marriage (18 years of age according to the first section of the "Marriage Law") as the standard, early marriage was very common in China before the 1950's. In 1949, the Chinese national early-marriage rate for women was 49.3 percent, 39.1 percent in the cities and townships and 51.5 percent in the countryside. As late as 1970, the national average early-marriage rate was still 18.6 percent and over 20 percent in the countryside. From 1949 through 1970 the average of annual early-marriage rates was 33.74 percent. After 1971, the decline accelerated

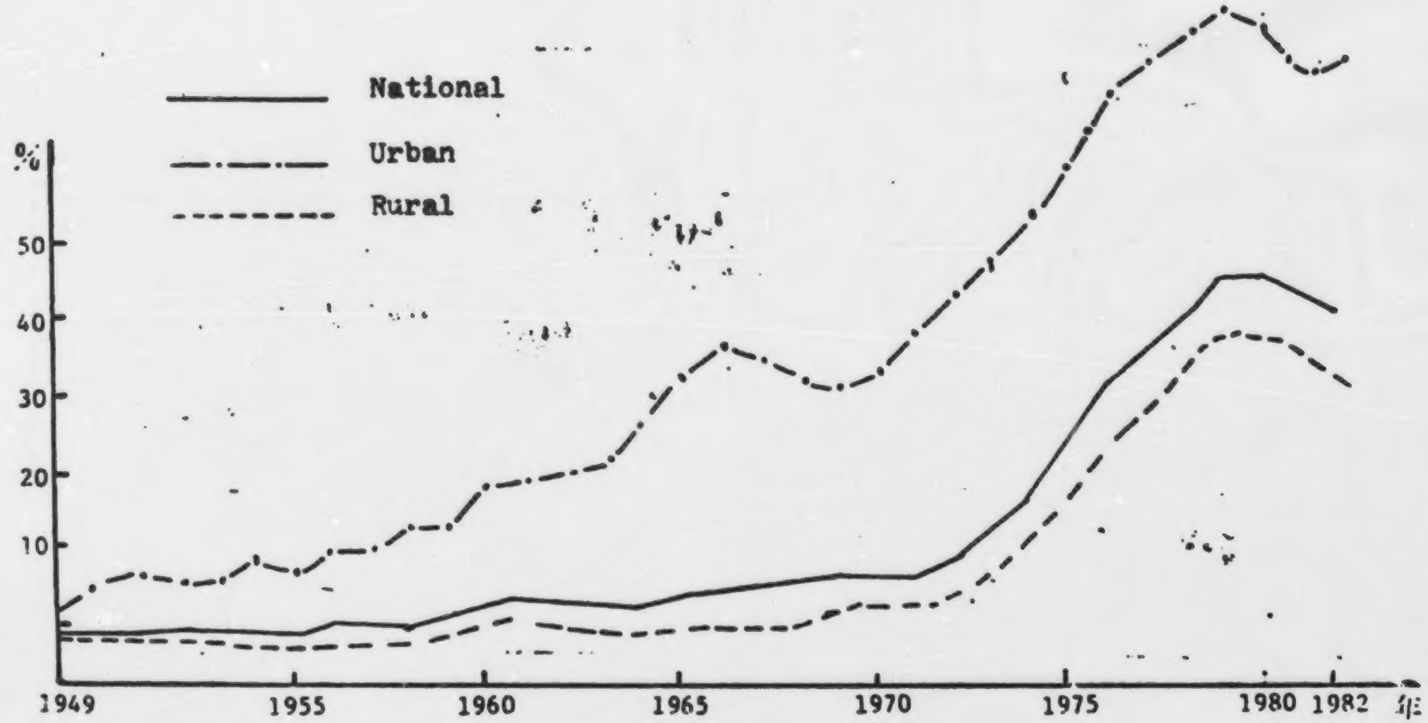

Figure 2. Late Marriage Rate for Women Marrying for the First Time (1949-1982)

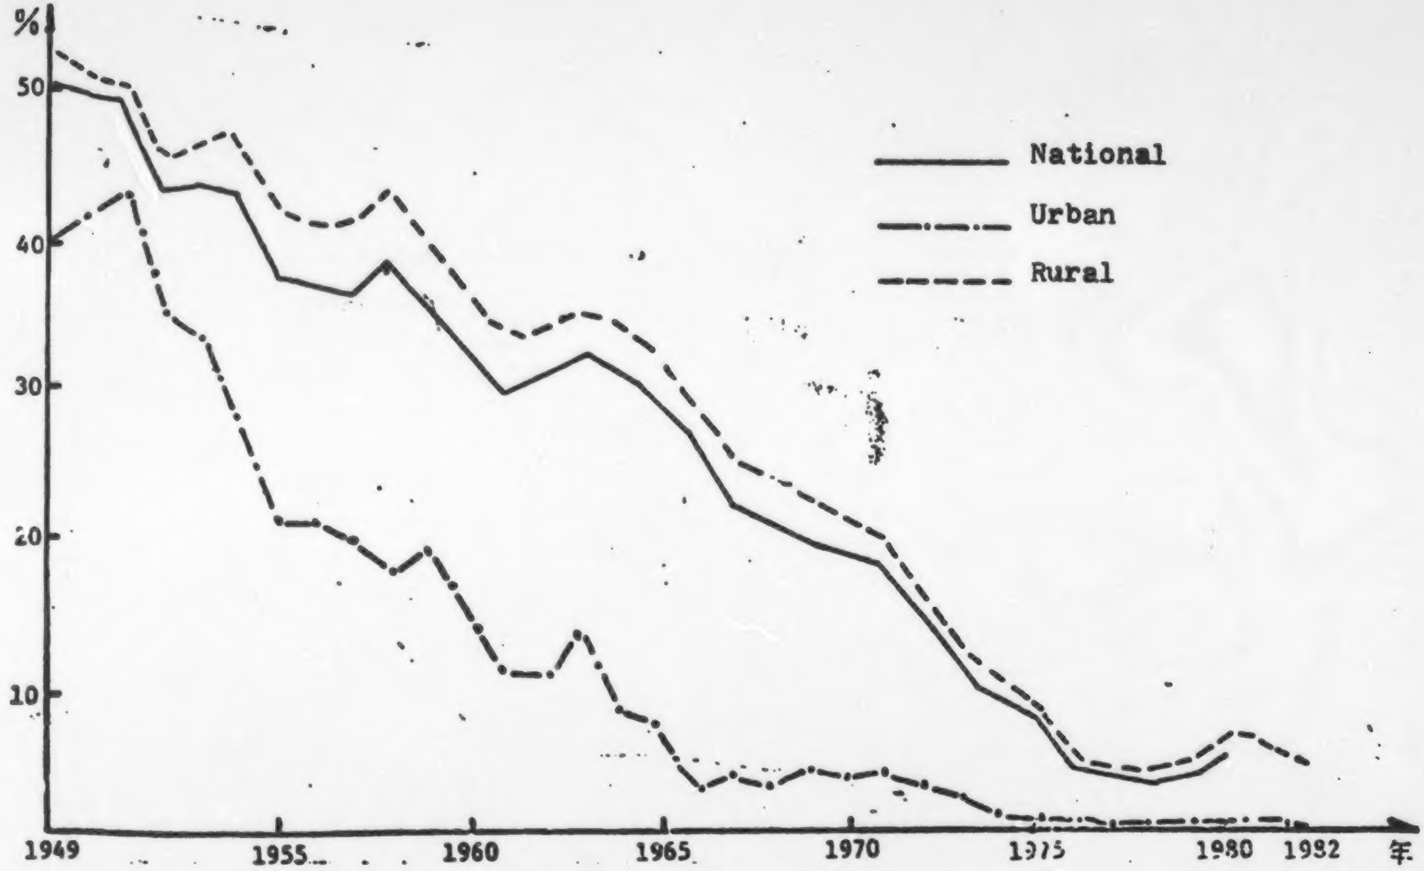

Figure 3. Early Marriage Rate for Females (1949-1982)

further, the rate dropping from 17.4 to 3.8 percent in 1982. The 1982 rate breaks down to 0.1 percent in the cities and townships and 4.7 percent in the countryside. The average annual early-marriage rate over these 12 years was just 7.34 percent, 3.6-fold less than the average annual early-marriage rate for the 22 years before 1970. From Figure 3 we can see that although there was a large decline before 1970 there were many fluctuations in it, but after 1970 there was a steady linear decline. Even in 1980, because of inadequate propaganda work for the promulgation of the new "Marriage Law," the early-marriage rate rose but very soon resumed its decline. This incident demonstrates the great achievements of China's late-marriage propaganda work.

The three principal characteristics of the change in the first marriages of Chinese women described above demonstrate a great historic change in the liberation of Chinese women from the old feudal marriage pattern and their adoption of a modern form of marriage. These three principal characteristics also show that with the increase in the age of women at their first marriage, births in a first marriage come later and the childbearing period is clearly shortened. This plays an important part in the decline of fertility and the control of population growth.

II. Changes in Overall Fertility

Overall fertility is one of the most important indices used to evaluate the achievements of family planning. The overall fertility rate is closely tied to a period's social and economic conditions, population policy, etc.

Since the founding of new China the overall fertility of Chinese women has clearly changed. The overall trend of development can be divided about the year 1970 into two periods. The period from 1950 through 1970 can be called the period of "fluctuating at a high level" while the years from 1971 to 1981 can be called the years of steady and dramatic decline. (See Figure 4)

1. The period of fluctuating at a high level: This period, which lasted 21 years, can, according to its fluctuations, be divided into three stages:

The first stage, from 1950 through 1958, lasted 9 years. The average annual overall fertility was 6.057, with a difference of just 0.793 between the high in 1952 and the low in 1958. From Figure 4 we can see that the curve representing overall fertility during these 9 years is high, steady, and broad with small peaks in 1952 and 1957. During this period, after 3 years of reconstruction, China began large-scale economic construction and the living standards of the people markedly improved. The population also entered an era of high growth with fertility holding at over 37 percent for 5 consecutive years from 1950 through 1954. During the middle of the 1950's, except in the national minority regions, birth control propaganda and promotional work was done in densely populated areas to encourage people to plan the births of their children. However for various reasons this work could not be done thoroughly. Family planning experiments were made in only a few large cities. For the nation as a whole, however, fertility was not under control. Thus, this stage can be characterized as having a high and relatively steady overall fertility.

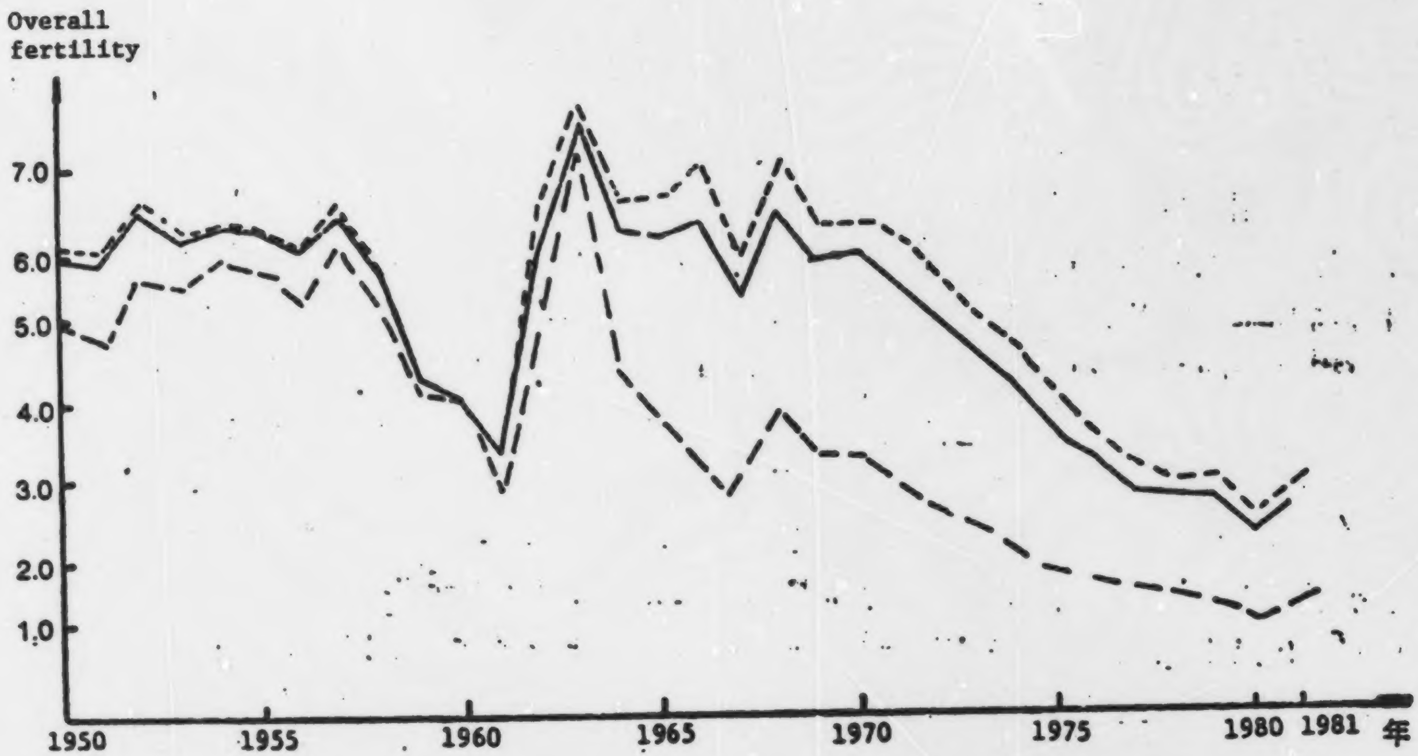

Figure 4. Overall Fertility for Women 1950-1981

The second stage extends from 1959 through 1963, a total of 5 years. Overall fertility during this stage had a deep depression and a high peak, the largest fluctuation since the founding of the PRC in 1949. During the years of steep decline, 1959 to 1961, the average annual overall fertility fell to 3.868, 2.189 lower than the average of the first stage. The lowest overall fertility, 3.287 in 1961, was 2.392 lower than the 5.679 of 1958, the first-stage year with the lowest fertility. During the two peak years 1962 and 1963 overall fertility shot up to over 6 with the peak coming at 7.502 in 1963, the PRC's historic high. The reason for these great fluctuations is clear: the "steep drop" in fertility was caused by the decline in births during the 3 years of economic difficulty. During the "great ascent," improvements in the national economy and in living standards brought a 2-year compensatory increase in births. Thus family planning has no direct connection with these fluctuations.

The third stage, extending from 1964 through 1970, lasted 7 years. During this stage the high overall fertility was similar to the first stage. However there is a clear difference between these two stages: the high fertility during this period was not as steady as during the first period and a gradual decline in fertility appeared. The average overall fertility was 5.972, 0.085 less than the 6.057 of the first stage. The peak, 6.448 in 1968, was 0.024 less than the 1952 peak of the first stage, 6.472. The year with the lowest fertility was 1967 at 5.313, 0.060 less than the lowest year of the first stage, 1958, at 5.253. This is because family planning, which had been discontinued in the 1950's, was restored to the agenda at the beginning of the 1960's. Family planning was developed in most cities and in some villages. Even when, beginning in 1966, family planning came under vigorous attack amidst the chaos of the "Cultural Revolution," producing a large oscillation as overall fertility rose to 6.448, the people, and especially families which had many children, wanted birth control. Thus, family planning did not come to a complete halt.

Another difference between the first and the third stages is that overall fertility declined faster in the cities than in the countryside. After the "great ascent" of 1963 urban overall fertility declined a total of 1.49 over 4 consecutive years, from 4.395 in 1964 to 2.905 in 1967. However in the countryside, the rural overall fertility climbed 0.391 from 6.567 in 1964 to 6.958 in 1966 before declining to 5.847 in 1967. In 1968, fertility rose in both the cities and in the countryside but the increase was much less in the cities than in the countryside. Rural overall fertility exceeded urban overall fertility by 3.153. During 1969 and 1970 the urban overall fertility declined to 3.299 and 3.267 while the rural overall fertility declined to 6.263 and 6.379, 1.9- and 1.95-fold the urban rates. Better economic, cultural and educational, and other conditions in the cities made family planning work better there than in the countryside; better results in efforts to control fertility were also obtained in the cities.

2. The period of steady and dramatic decline in fertility: During the 11-year period 1971 through 1981 overall fertility declined steadily and dramatically. The annual average overall fertility rate for this period declined to 3.566, 2.501 lower than the average for the years 1950 through 1958 and 2.406 lower

than the average for the years 1964 through 1970. Figure 4 shows that the decline from 1971 to 1980 is nearly a vertical drop. In 1981, there was a large recovery when fertility increased by 0.393 over 1980. This was because with the promulgation of the new marriage law the marriage age of several age cohorts decreased and some women who had married late had their first child, putting the 1981 first-born child fertility at 1.162, an increase of 0.869 over the 1980 first-born child fertility. Moreover once family planning was relaxed the second-born and third and successive child fertilities also rose. Considering the broad trends of development, however, the increase in 1981 does not show any significant pattern and did not have a great influence on the overall downward trend. Immediately thereafter, in 1982, the decline picked up once again and overall fertility reached 2.1 in 1983.

The principal and most direct cause of the steady and drastic drop in overall fertility since the 1970's is, aside from socioeconomic factors, the thorough implementation of family planning throughout the country. During this period, family planning developed even further on the foundation built during the 1960's. Population growth became a consideration in national economic planning and special organizations were set up at the county level and below, specialized cadres were dispatched, the specific requests that marriage and giving birth come late, the broad development of propaganda and education, and the popularization of birth control measures all played a part. Especially since the 3d Plenum of the 11th CPC Central Committee when the establishment of family planning as a fundamental national policy and its insertion in the state constitution, family planning has been promoted energetically and successfully. From 1979 to 1982, the average step increase in the population was 13.44 percent.

3. The distribution of fertility during the childbearing years has also changed markedly: The most evident change in the distribution of fertility in the childbearing years is in the decline in the relative fertility of women in the cohorts 15 through 19 and in the cohorts over 30. Relative fertility of the cohorts aged 15 through 19 years of age declined from 7.15 percent in the 1950's to 2.55 percent during the 1980's while for the cohorts over age 30 relative fertility declined from 46.12 percent during the 1950's to 22.85 percent during the 1980's. This demonstrates that controlling early marriage and the tendency to have several children is the key to reducing overall fertility.

III. Changes in Birth-Order Fertility

Changes in birth-order fertility are closely connected to changes in overall fertility. They reflect another aspect of family planning's achievements. According to analyses of data from the one one-thousandth population sampling survey, "Distribution of the Birth of Infants According to the Birth Order of the Infant in the Mother's First Marriage During 3 Years," the fertility pattern of Chinese women is already changing from giving birth early with little spacing between births and having many children to have children late and widely spaced and having few children. (See Table 1) This is shown below:

Table 1. Changes in Birth-Order Fertility for 1970, 1977, and 1981

		First-Born		Second-Born		Third, Later	
Year	Births	Number	Percent	Number	Percent	Number	Percent
1970	29,295	6,073	20.73	4,998	17.06	18,224	62.2
1977	19,997	6,171	30.86	4,918	24.59	8,908	44.55
1981	21,342	9,938	46.57	5,411	25.35	5,993	28.08

1. First-born fertility rose sharply, fertility for third and later children dropped abruptly while there was no apparent change in second-born fertility. From Table 1 we see that first-born fertility increased from 20.73 percent in 1970 to 30.86 percent in 1977 and then still further to 46.57 percent in 1981. The increase from 1970 through 1981 was 124.86 percent. During this great increase in first-born fertility, fertility for third and later children declined sharply from 62.2 percent in 1970 to 44.55 percent in 1977 and again to 28.08 percent in 1981. The decline from 1970 through 1981 was 121.55 percent. Although second-child fertility tended to rise slightly this trend was never very clear cut.

The change in birth-order fertility over these 3 years shows clearly that family planning has been most effective in controlling births of third and successive children. As mentioned previously, in 1970 overall fertility was in a period of "fluctuating at a high level." That year third and successive births were the dominant element in the birth-order fertility structure. However, by 1981 first-birth fertility had taken over the leading position from fertility of third and successive children; overall fertility declined accordingly.

2. The distribution of birth-order fertility after marriage also changed considerably (see Figure 5). From Figure 5.1 we can see in comparing these 3 years that the proportion of women giving birth to their first child within 5 years after their first marriage steadily increased from 94.29 percent in 1970 to 95.35 percent in 1977 and further to 97.51 percent in 1981. The second year after marriage is the peak year for giving birth to the first child. This peak became more pronounced as the proportion of women giving birth to their first child in the second year after their first marriage climbed from 50.82 percent in 1970 to 51.57 percent in 1977 and again to 56.52 percent in 1981. Undoubtedly this is the result of encouraging women to marry late and have children late which made the births of first children cluster more closely together.

From Figure 5.2 we can see that the period in which women have their second child is concentrated in the third through the seventh years after their marriage. The proportion having their second child in the fourth or fifth year after marriage is greatest and this proportion tends to increase. In 1970, 47.32 percent of the second-born children were born in the fourth or fifth year after their mother's marriage. This proportion climbed to 49.92 percent in 1981. This shows that the spacing between first- and second-born children is tending to increase and that there has been a very great change in the traditional practice of closely spaced births.

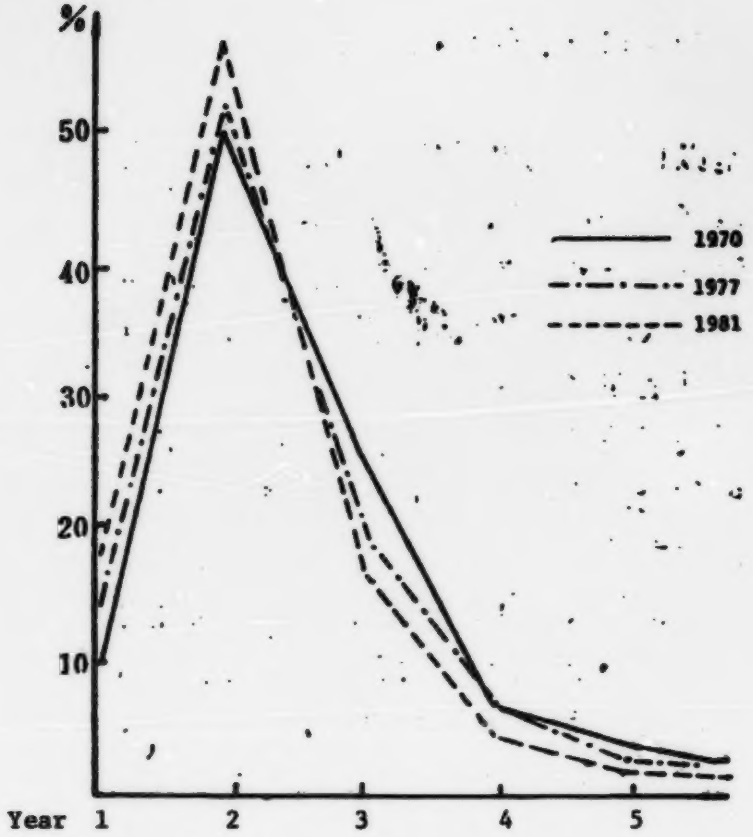

Figure 5.1. Distribution of the Fertility for First-Born Children in the First 5 Years After the First Marriage

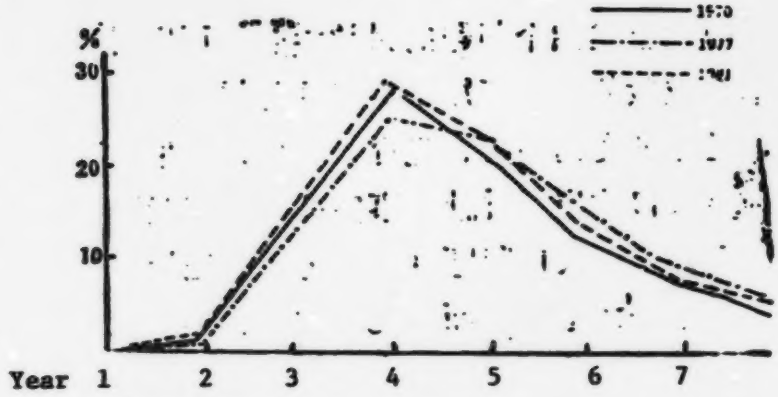

Figure 5.2. Distribution of the Fertility for Second-Born Children in the First 7 Years After the First Marriage

There is no discernible trend in the period after marriage in which third and successive children are born. The distribution begins in the third year after the first marriage and exists in each year thereafter but the proportion after the fifth year of marriage is very low.

IV. Discussion

From the discussion above we can discover several systematic issues.

1. The average age of women at their first marriage and the late marriage rate of women increased together. As the average age at first marriage and late marriage has increased, the average age of childbearing in a woman's first marriage increases correspondingly. These changes demonstrate that in the 30 years since the founding of the PRC there has been a fundamental change in the bad custom of marrying early and having children early.

2. Overall fertility and the fertility for third and successive children declined together. Accordingly the birth-order fertility structure of women changed as well and first-child fertility and second-child fertility came to absolutely dominate the fertility situation. This demonstrates that the childbearing intentions of China's women have clearly changed from the fertility pattern from having many children early and closely spaced together to having few children and having them late and well spaced. In just 30 short years the fertility of Chinese women has made a historic change in going from a high level to the replacement level.

3. There is a clear difference between the city and the countryside. Differences between the city and the countryside are evident in the age at first marriage, overall fertility, and birth-order fertility. For example in 1982 the average age of women at their first marriage in the countryside was 12.96 percent lower than in the cities and townships. The late marriage rate in the countryside was less than one-half what it was in the cities and townships while the early-marriage rate is 46 times greater. In 1981, rural overall fertility was 1.09 times urban overall fertility. Rural fertilities for the third, fourth, fifth, sixth and above children were 16.8, 33.7 and 366 times the urban rate. This to a certain degree reflects the influence of different economic, cultural, and educational factors on marriage and fertility. It also demonstrates that a great potential remains in the rural areas to contribute to raising the average age at first marriage, the late-marriage rate, and to reduce the fertility for third and successive children as well as overall fertility in order to contribute to achieving the goal of controlling population growth before the end of this century.

4. Analyzing these periods temporally, each of the changes described above took place about 1970. Up until 1970, although all of these changes were already taking place they were relatively small and there were many fluctuations. From 1971 onward nearly all these changes became linear and moved along more quickly than they had up to 1970. In the 30 years since the founding of the PRC, marriage and fertility have changed steadily along with the development of society and the economy. However the abrupt change that has been taking place since the 1970's is the result of the vigorous

promotion of late marriage and family planning. The decisive and widespread effect of policy in many areas shows that China's family planning policy has for a long time received the endorsement and support of the people and certainly could not have been so effective if it had depended on force to achieve its goals.

We can arrive at the following conclusion after our discussion of the four issues above: China's family planning policy is successful and extremely effective. In just 10 short years, the fertility pattern of China's women has changed from one in which women were marrying early and having many children closely spaced at an early age to one in which they were marrying late and having few children and superior children when they are older. This not only contributes to solving China's population problem but also to controlling world population. Under the condition that China's large population grows very quickly, and China's economy and technology are still backward, we cannot solve the population problem through Western-style "family planning" and still less can we control population growth through the "free market economy." We can only solve this problem through a Chinese version of family planning. We can do this, under the guidance of the socialist planned economy, by grasping at the same time the "two kinds of production." On the one hand, we should vigorously develop production, accelerate the pace of economic construction, and build a high socialist material culture; on the other hand, we should make population an integral part of the plan for the entire national economy, encouraging family planning parenthood, late marriage, giving birth late, having few children, having better children and gradually building a high socialist spiritual culture. The Chinese version of family planning is not only appropriate to Chinese culture but also can be a valuable reference point for many developing countries in the Third World.

CAAC TO ORDER 40 MORE CHINESE-MADE AIRCRAFT

OW300747 Beijing XINHUA in English 0726 GMT 30 May 86

[Text] Beijing, May 30 (XINHUA)--Chinese aircraft manufacturer are going to provide the Civil Aviation Administration of China (CAAC), China's national flag carrier, with 40 yun 7-100 passenger planes in the coming 5 years, an official of the Aviation Industry Ministry said here today.

The official told XINHUA that this is part of efforts to further develop China's aviation industry, and the industry will also try to sell civilian aircraft in the international market.

The agreement on the deal was concluded recently between CAAC and the ministry.

Only 2 weeks ago, CAAC announced that it has signed 850 million-worth of contracts to buy 10 jumbo jets--four Boeing 747's, four Boeing 737's and two airbus A310S.

It was learned that 40 China-made aircraft will go into service on domestic air routes to and from Shanghai, Chengdu, Xian, Shenyang, Beijing, Guangzhou, Kunming, Urumqi and other cities.

The official said the industry will manufacture 10 aircraft this year. Equipped with improved radar and navigation facilities, the yun-7-100 can carry 52 people.

During the 1986-90 period, he said, "our aircraft manufacturers will provide more than 200 planes of various models for CAAC, provinces and autonomous regions. We will improve quality and offer good service."

At the same time, the industry will promote international cooperation by doing processing with supplied materials, importing technology and co-designing and manufacturing new passenger planes, and planes for farm and forestry use.

Much headway has been made in the past few years. The industry is now manufacturing wing boxes, cabin doors, engines and other parts for 10 types of aircraft, including Boeing 737's, Airbus A320S and MD-82's.

Up to now, the industry has concluded 80 million-worth of contracts for processing aircraft parts for nine firms, including Boeing, Sikorsky Aircraft and the Canadian Aircraft Company.

Aircraft-part assembly with supplied materials is undertaken in a dozen aircraft factories in Shanghai, Xian, Shenyang and Harbin.

Negotiations are still under way between Chinese aircraft makers and foreign firms to produce parts for ATP and Dash-8 aircraft.

TAIWAN

ECONOMICS MINISTER REAFFIRMS FREE TRADE POLICY

OW071439 Taipei CNA in English 1419 GMT 7 Jun 86

[Text] Taipei, June 7 (CNA)--Economics Minister Lee Ta-hai reaffirmed Saturday that the Republic of China [ROC] will continue implementing market-opening measures and lowering import tariffs in order to speed up economic transformation.

Minister Lee said that as overprotection of domestic industries will hamper industrial upgrading and inflict unfair burden on local consumers, the ROC Government will open its market for more foreign products.

To help local manufacturers survive foreign competition, Lee said, the government has reduced bank interest rates and business tax rates to help cut production cost. The government also has streamlined its overseas commercial offices in an effort to establish a local market information collecting network as well as help local industrialists make direct investments abroad.

Lee further pointed out that 98 percent of local industries are medium- or small-size businesses, most of which lack capability to collect latest market information, design new products and establish direct sales. The government will give priority to the argument of local industry's scale, he said.

Lee made the remarks at a citation ceremony for the country's outstanding exporters in 1985. The minister presided over the ceremony at the Taipei World Trade Center, in which 372 top exporters were honored.

TAIWAN

BOFT CRITICIZES U.S. PROTECTIONIST MEASURES

OW071129 Taipei CNA in English 1022 GMT 7 Jun 86

[Text] Taipei, June 7 (CNA)--The United States regards the Republic of China [ROC] as one of the economic powers in the world today judging from the fact that many trade protectionist measures taken by the United States are directed at this nation.

The Board of Foreign Trade [BOFT] under the Ministry of Economic Affairs is worried that the United States intends to phase out the generalized systems of preference [GSP] treatment of ROC-made products being exported to the United States by casting an image of the Republic of China as one of the developed nations.

Following the U.S. Government request that the Republic of China, Japan, West Germany and Switzerland take the initiative in imposing quotas on their respective exports of tool machineries to the United States over the next 5 years, the U.S. House of Representatives, with a two-thirds majority vote in late May, passed the omnibus trade bill, asking the Republic of China, Japan and West Germany to reduce their respective trade surplus with the United States by 10 percent annually starting in 1987.

Judging from the above-mentioned examples, a spokesman for the BOFT says, the United States has created the impression in the international community that the Republic of China has entered into the ranks of advanced nations like Japan, West Germany and Switzerland.

He notes that the United States has been trying to delete the ROC from the list of developing nations that are entitled to the U.S. GSP treatment because it wants to improve the huge trade imbalance with the ROC, which reached a record high of about U.S. $10 billion in 1985.

In recent years, the ROC has been enjoying the greatest benefit of any nation under the GSP system. For instance, the BOFT spokesman says, the ROC's duty-free exports to the United States amounted to U.S. $3.22 billion in 1985, accounting for 24.17 percent of the total U.S. duty-free exports under the GSP system last year. It also represented 21.7 percent of the total ROC's exports to the United States in 1985.

The spokesman explains that the economic development in the Republic of China still lags behind that in the industrialized nations, although the rapid economic development in this nation has been recognized by other nations with admiration. For example, the per capita income of the ROC was about U.S. $3,000 in 1985 and it was far lower than the more than U.S. $10,000 registered in the United States, Japan, West Germany and Switzerland.

Besides, he says, although the ROC's total two-way trade reached U.S. $50 billion and was listed as one of the top 20 trading nations in the world in 1985, the majority of the ROC-exported goods were products assembled here from imported spare parts and components or those of the less technology-intensive industries. This shows that the industrial and technological standards in this nation are still lagging far behind those in the advanced nations.

Therefore, the BOFT spokesman says, the ROC is still a developing country and should continue enjoying the U.S. GSP treatment. It will be unfair to graduate the ROC from the GSP beneficiary list because even Singapore and Hong Kong, whose per capita incomes stood at some U.S. $7,000 and U.S. $5,000 respectively, are still entitled to the GSP treatment, he adds.

To effectively improve the huge trade imbalance with the United States and ease the U.S. trade protectionist pressure on the ROC, the BOFT has suggested related government agencies to strive for the purchases of Alaskan crude oil and high technology equipment and products, and consider giving priority to American aircraft and equipment when purchasing for China Airlines and such major construction projects as nuclear power plants.

The BOFT, however, says that to improve the huge trade imbalance between the ROC and the United States is not a responsibility on the part of this nation alone. To assist American manufacturers in exploiting the ROC market, the BOFT sponsored an American products exhibition in Taipei last March. But American businessmen did not take part in the exhibition enthusiastically.

According to the BOFT spokesman, the ROC will enhance propaganda activities in the United States in the near future telling Americans the strong purchasing power of the ROC people in the hope that American manufacturers will be attracted to exploit the ROC market.

The BOFT, however, also hopes that American businessmen will take the initiative in studying the ROC market and setting up branch offices in Taipei to market their products. Thus, the huge trade imbalance between the two countries will be greatly improved by expanding the exports of U.S. products to the Republic of China, the spokesman adds.

EDITORIAL VIEWS TRADE SURPLUS WITH U.S.

OW040641 Taipei CHINA POST in English 1 Jun 86 p 2

[Editorial: "A Proper Response to the High Tide of American Protectionism"]

[Text] Recently the House of Representatives of the United States' Congress passed a bill setting out very strong protectionist measures to be taken against the Republic of China, Japan and West Germany, all of which have large trade surpluses with the United States. In essence, these three countries would, according to this bill, be asked to reduce, starting from 1987, their favorable trade balances by 10 percent each year until such time as the trade balance is not regarded as being excessive. It remains to be seen whether the Senate will go along with this, but President Reagan has made it clear that he will veto any such bill passed by Congress.

However, from our point of view, we should not, and cannot, ignore the basic forces at work which made it possible for the House of Representatives to pass such a highly protectionist bill. The United States has experienced a persistently unfavorable balance of merchandise trade (i.e. where imports have exceeded exports) for more than 15 years. Prior to 1971, it almost always had a favorable balance each year, but beginning with that year the opposite has prevailed (with the exception of 1973 and 1975, the only 2 years in which there was a favorable balance. In addition, the size of the unfavorable balance has been increasing. In 1971 the total unfavorable trade balance was only U.S. $2 billion. It grew to be nearly $40 billion in 1981, and after 1982 it jumped by leaps and bounds. In 1985, the total unfavorable trade balance was as much as $148 billion, nearly 5 percent of U.S. national income.

Why has the American trade balance become so unfavorable? In our view, Ronald Reagan should bear as much of the blame as anyone else. And is well known, his economic philosophy called for a cut in taxes and in government expenditure. After he was elected, he succeeded in doing the former, but not the latter. Large budget deficits resulted. However, the Federal Reserve refused to finance the deficits with an easy monetary policy. Consequently, interest rates went up sharply. Rising interest rates together with favorable investment environment attracted a large inflow of foreign capital into the United States, which meant an increase in demand for the American dollar. Thus the American dollar became increasingly strong. A strong dollar was of course bad for exports but good for imports, and so a trade deficit resulted. It was not until last year that the United States began, with the help of her European allies, to take steps to depreciate the dollar. However, it will take some time before the effects of the depreciation of the dollar are felt.

The protectionists in the United States are not so interested in an analysis of the causes of the American trade deficit as they are concerned with the threat of the ever increasing imports. As a consequence, they are not so interested in finding a proper cure for the evergrowing trade deficit, that is, a reduction of the budgetary deficit, as they are in lobbying support for protectionist legislation. They know that in terms of American politics, it is much harder to get sufficient support to reduce the budgetary deficit significantly than it is to blame foreigners for high unemployment and poor business at home. To be sure, a protectionist policy will harm American consumers, but the consumers are not organized to protect their own interests, while the industries which are threatened by imports are. These special interest groups try hard to put pressure on Congress to protect and further their interests. So, as long as there is a large trade deficit, there will always be a good chance that the protectionists will succeed. As long as we have a large favorable trade balance with the United States, we always [will] be a target of American protectionism.

We have had a favorable trade balance with the United States every year since 1968. In 1968 it was only U.S. $39 million. It grew to be $725 million in 1973. By 1984, it was up to $9.826 billion.

Our large favorable trade balance with the United States is not really beneficial to us. Our persistent trade surplus with the United States has caused our foreign exchange reserves to increase sharply. An excess amount of foreign exchange reserves such as we have is harmful in two major respects. First, it means there is a large outward movement of capital which we can ill afford movement of capital at home in order to upgrade the structure of the economy and realize a high rate of growth. Secondly, disproportionately large foreign exchange reserves bring inflationary pressure to bear on the economy, which we need to alleviate in order to achieve price stability, an essential ingredient of sustained and equitable economic growth.

Thus our proper response to the rising tide of American protectionism should not be one of just blaming the American protectionists, or laughing at their irrationality or short-sightedness. Instead, we should concentrate our efforts on finding ways to reduce our favorable trade balance with the United States. We are glad to see that our government is doing just that.

MINISTRY AGREES IN PRINCIPLE TO LOOSEN INVESTMENT LIMITS

OW090323 Taipei CNA in English 0253 GMT 9 Jun 86

[Text] Taipei, June 7 (CNA)--The Ministry of Economic Affairs has decided in principle to gradually loosen restrictions on foreign investments in trading companies here as a part of its effort to liberalize and internationalize the nation's economy.

Economics Minister Lee Ta-hai made the directive after listening to a report by Vincent C. Siew, director general of the Board of Foreign Trade [BOFT], on a proposal to allow foreigners and overseas Chinese to make investments and run trading companies in this nation.

Siew pointed out in his report that South Korea since April has opened its import and export businesses to foreign investors on certain conditions. At present, foreign businessmen here are restricted to handle imports and exports related to products manufactured by their companies in this nation, he said.

It is necessary for foreign-invested manufacturing industries to engage in foreign trade related to their products here, but it will be completely different situation and unfair to local traders if all foreigners are allowed to run trading companies here, Siew said.

Lee has directed BOFT to study merits and demerits of opening the nation's foreign trade businesses and come up with a report on its feasibility. In principle, the government has decided to gradually loosen its foreign trade market, he said.

PREMIER YU AWARDS TOP EXPORTERS FOR 1985

OW071219 Taipei CNA in English 1001 GMT 7 Jun 86

[Text] Taipei, June 7 (CNA)--Thanks to concerted efforts to the government and the private sector, the Republic of China [ROC] has become the 10th largest exporting country in the world, Premier Yu Kuo-hwa said Saturday morning.

Speaking at an award-presentation ceremony for the top exporters of last year, Premier Yu said that the ROC registered record exports of U.S. $30.7 billion in 1985. Although the amount was only up 0.9 percent from the 1984 level, Yu said, it was a remarkable achievement in the face of a worldwide economic downturn and growing protestionism.

Yu said, however, that the nation should still put more emphasis on upgrading product quality, diversifying export markets and following a free trade policy.

The awards ceremony was held Saturday morning at the Taipei World Trade Center with Economics Minister Lee Ta-hai presiding.

Altogether, 372 outstanding export firms were honored at the ceremony. Premier Yu conferred special-class awards on 14 companies, each of which exported more than U.S. $100 million of goods last year.

Economics Minister Lee presented first-class awards to each of 23 companies with exports of more than U.S. $50 million but less than U.S. $100 million.

The director general of the Board of Foreign Trade [BOFT], Vincent C. Siew, gave second-class awards to 305 companies whose 1985 exports were more than U.S. $10 million but less than U.S. $50 million.

Thirty other companies were also honored for successfully promoting their products in foreign markets.

The BOFT said Friday that 5482 ROC companies exported at least U.S. $1 million worth of goods last year. All of them were put on the list of the ROC's outstanding export companies for 1985.

The E-Hsin International Corp in Taipei topped the list of outstanding export firms with exports exceeding U.S. $260 million last year. The company registered in 1985 an export growth of 143.8 percent compared with the preceding year.

The exports of the 14 top exports firms in 1985 totaled U.S. $2.30 million, or 6.6 percent of the ROC's export total, which amounted to U.S. $30.7 billion.

BRIEFS

FOREIGN TRADE INCREASES IN MAY--Taipei, June 7 (CNA --The foreign trade of the Republic of China jumped by 10.59 percent to U.S. $5.05 billion in May over the same month previous year, according to statistics released by the Directorate General of Budget, Accounting and Statistics. Of the total foreign trade in May, U.S. $3.13 billion was export-related, registering a 16.7 percent growth over the figure of U.S. $2.68 billion for the same month last year. The balance went to imports, which showed a 1.87 percent increase over a year ago. The country's foreign trade during the January-May period totaled U.S. $23.85 billion, up 13.35 percent over 1985's U.S. $21.04 billion and pushing ROC's trade surplus to U.S. $5.47 billion. JOURNAL REVIEWS PRICE ADMINISTRATION SYSTEM TRANSITION ISSUE

HK031531 Beijing JINGJI YANJIU in Chinese No 3, 20 Mar 86 pp 48-53

[Article written in October 1985 and revised in January 1986 by Zhang Weida [1728 4850 6671] of the Economic Management Institute of Jilin University: "Reflecting on the Chinese Model of Price System"]

[Text] Price reform consists of the reform in two spheres--price structure [ti-xi 7555 4762] and price system [ti-zhi 7555 0455]. Under our country's socialist conditions, selecting a model of price system that facilitates the rationalization of our price structure and correctly bringing into play the functions of price is one of the goals that our country's price reform should study and attain.

I. In Selecting the Price System Model, We Must Soberly Understand the Dual Functions of Price

The most serious shortcoming of our country's previous price system was that it prevented prices playing their functions. Our discussion and study of the price system model now is precisely aimed at giving better play to the functions of price. Knowledge about the functions of price and the characteristics of these functions is an important theoretical precondition for the selection of the price system. There are different views on the functions of price. Some people say that price had a function to express price and a regulatory function; others say that the functions of price were to regulate production, guide consumption, balance supply and demand, facilitate accounting work, and so on. I think that we should make a distinction in our understanding between what is price, what are the functions of price, and what role price plays, though these three questions are closely related. Usually, we say "price is value in terms of money." This refers to the question of what is price. However, "the (social) transformation of value into (specific) prices has undergone an extremely complicated path rather than a simple and direct path." (Footnote 1) (Lenin: "Karl Marx," "Selected Works of Lenin," vol 2, p 595) Prices passively reflect value around value as the axis. In fact, price level shows how much the value of commodities is realized. The degree of the realization of the value of commodities is directly linked with the immediate interests of the people participating in the commodity economy (including sellers, buyers, priducers and consumers). Every fluctuation of price around the axis of value will give rise to transference of economic interests.

Therefore, the basic function of price is to regulate the economic interests of the people who participate in the commodity economy. It is precisely in the process of fluctuation that prices implement the objective requirements of the law of value and regulate the economic interests of the people participating in the commodity economy. Only by so doing can prices play their role as an effective economic lever in the production, exchange, distribution and consumption processes of a society.

The function of prices in regulating economic interests directly affects the immediate interests of the participants in the commodity economy. Therefore, naturally the regulatory function of prices is of dual nature: On the one hand, through immediate interests, it urges enterprises of conscientiously reduce their consumption of labor and be concerned about the changes in marked demand and can thus imbue commodity production and operation with vitality; on the other hand, precisely because it starts from the interests of the enterprise itself in invigorating the commodity production and operation of the enterprise, it unavoidably gives rise to some blindness. The "Resolution of the CPC Central Committee on Reform of the Economic Structure" is very clear about this. While saying, "only by fully developing the commodity economy can we really enliven our economy," it points out: "the widespread development of the commodity economy may also give rise to some blindness." Therefore, it is very natural that as a mechanism for the operation of a commodity economy, price plays a dual regulatory role. Neither a capitalist nor a socialist commodity economy is an exception. The difference is: under capitalist conditions, it is impossible to overcome the blindness caused by the regulatory role of prices; while under socialist conditions, it is possible to conduct planned macroeconomic guidance and regulation and exercise administrative control over the blindness caused by the regulatory role of prices. This is precisely what is superior in a socialist economic system.

In order to have a sober understanding of the dual role in the functions of price, we should be careful that we do not negate this regulatory function because of the blindness caused by the regulation by prices. However, we should not overlook the blindness that may be caused by regulation by price, in stressing the positive role of the regulation by price. In the past, our price economic rigidity. We must resolutely reform this. Now, we have reformed our price system, relaxed our control over prices, allowed prices to fluctuate, and thus roused the vigor and vitality of our enterprises, but relaxation does not mean the adoption of a laissez-faire attitude and the giving up of macroeconomic control. Our discussion about and study of a model for our price system are precisely aimed at giving full play to the superiority of the socialist system and looking for a form of price management that facilitates controlling the blindness as well as enlivening our economy.

II. Our Model of Price System Must Meet the Requirements of the Planned Commodity Economy Founded on Public Ownership

A model of price system means a certain pattern of price administration system or a certain type of price management system and is generally shortened as price model. It is a form of the realization of the rationalization of price structure in order to give play to the functions of price. Price system means the relations of price disparity and the price relations between commodities reflected on the basis of the law of value. The contents of price system are the same under the conditions of any commodity economy. This is a general character of price as a relation of exchange. However, the price administration system that is adopted to form price structure, regulate price disparity, and rationalize price relations varies as the nature of commodity economy and national conditions vary. The model of price system that we are discussing and studying is nothing but a socialist price administration system, and in addition, is a socialist price administration system with Chinese characteristics and full of vigor and vitality.

How should we select our price system model? People generally think that as a type of price administration system, a model of price administration system consists of a decisionmaking system, a regulatory system, a motivation system, an organization system, and so on. These components are determined by the different forms in which the objective law of price formation shows itself under different commodity economic conditions, in other words, the different forms of price formation. Different forms of price formation determine different price decisionmaking systems, regulatory systems, motivation systems and organizational systems. Therefore, in selecting the model of price system, what is most vital is to discuss and study the forms of price formation under different commodity economic conditions. In the world at present, there are in the main two major kinds of price model owing to different types of commodity economy: One is the free price model in which prices take shpae spontaneously entirely through the regulation of market mechanism under the conditions of the anarchic capitalist commodity economy. The other is the planned price model in which prices take shape in a planned manner under the conditions of a planned socialist commodity economy. Even in socialist countries, price models vary as their national conditions vary. Some of them adopt the centralized and planned price model; others adopt a decentralized model of free prices under the guidance of supply and demand relations; still others adopt a mixed planned and market price model. In selecting our country's model of price system, we should adhere to the principle of socialism and start from our national conditions. In my opinion, there are in the main the following objective bases for our consideration:

First, it should reflect the requirements of our country's planned commodity economy that is established on public ownership. Under socialist conditions, planned economy is not in conflict but is in unity with commodity economy. This determines that the form of price formation in our country is necessarily an organic unity between planned formation and the regulation of market mechanism. The price of pitting one of these two forms of price formation against the other does not conform to our country's socialist economic reality. Nor does the practice of allowing only centralized and planned price formation or allowing only the spontaneous formation of prices by the regulation of market mechanism.

Second, it should be suited to the planning system that our country has established and that consciously applies the law of value. The price administration system is an important constituent part of the whole socialist economic system and is in particular very closely related to the planning system. Our country's socialist planning system must consciously follow and apply the law of value and is a system that combines centralism with flexibility. Our planning system must coordinate and must not be in conflict with our price administration system. This requires that the form of price formation in our country should consciously follow the law of value and should be a form that combines the centralism of planning with the flexibility of the regulation of market mechanism.

Third, it should be conducive to the development of social productive forces. The fundamental task of socialism is to develop social productive forces. In order to fulfill this task, we must radically change the rigid model of price system that hinders the development of our productive forces. We should enable the forms of price formation to correctly play the role of economic regulation and to facilitate not only enlivening our enterprises but also controlling blindness and thus promote the vigorous, planned, and proportionate development of our entire national economy. In order to conform to the diverse levels of productive forces, diversified economic forms, and planned commodity market system in the current period in our country, we are now adopting pluralistic forms of price formation including planned prices fixed by the state in a centralized manner, floating prices within planned ranges, and free prices. The above three forms of price each has its scope of application and functions and they should not be regarded as equals. Judging by the above-mentioned objective basis for the selection of our country's price model, I think that the principal model of price system for our country should not be the state's unified price or the free price but should be the floating price within a planned range.

Planned prices set by the state in a centralized manner has the advantage of direct planned regulation, but it has the disadvantage of not being able to sensitively reflect the change in value of commodities and in the supply and demand relations in the market; therefore, it should not be the principal form of price formation in the price system of our country's planned commodity market. This form of price formation is suited only to a small number of important commodities that are vital to our national plans and people's livelihood and that are directly controlled by our state. As the system of the state's indirect control takes shape and becomes perfect, we should gradually reduce the scope and percentage of the goods whose prices are set by the state in a centralized manner. Of course, it is not appropriate to entirely abolish this form of price formation in order to facilitate the state's direct control over the economic lifelines, in order to enable it to take part in the regulation by market mechanism and in order to bring into play its dominant role in regulating our national economy.

As for free prices, their greatest advantage is their ability to sensitively reflect the complicated and always changing supply and demand relations in our market; while their major defect is precisely that their entirely spontaneous formation through the regulation of market mechanism makes it impossible for them to be free from blindness. Even if we have perfected our system of indirect control, this defect will not disappear. We must be clear that our country's commodity economy is not a capitalist economy, but is a socialist commodity economy and that the model of price system that we select is nothing but a socialist price administration system. We should not fail to learn from the lessons that some socialist countries have drawn from their implementation of the model of free prices under the guidance of supply and demand relations, let alone the lessons drawn from the consequence of the capitalist countries' implementation of the model of free prices entirely regulated by market mechanism. In order to meet the requirements of the planned commodity market system, our country should establish a sound system of indirect control. The state precisely applies price--the most effective economic lever (in coordination with application of diverse economic levers such as credit, taxation, and exchange rates)--as a major part of its planning to indirectly control and regulate the operation of its commodity economy. We can say for sure that there is a necessity for free prices to exist in our country in the present period. However, it can only be a useful supplementary form of economic regulation and cannot be the principal part of our country's price system.

The floating price within the planned range has the advantages of both the planning mechanism and the market mechanism, is conducive to microeconomically and sensitively reflecting market changes as well as to macroeconomical and planned control, and embodies not only the regulatory functions of planning but also the functions of the regulation of market mechanism. Therefore, it can be said to have the functions of both mechanisms. Since our country's socialist economy is a planned commodity economy on the basis of the public ownership and since it is not a free market economy on the basis of a private ownership, the typical form of price formation for our country must be the form of floating prices within planned ranges and must not be the form of free prices without planning. As our planned commodity market system gradually becomes perfect, the state's planned control will gradually switch from the practice of mainly exerting direct control to that of mainly exerting indirect control. As a result, the scope of floating prices within planned ranges must be correspondingly enlarged and become the principal form of our country's price system. I favor the view that the principal part of our country's price model should be the model of floating prices. To be more specific, it should be a price model with the planned prices set by the state in a centralized manner as the leading factor, with floating prices within planned ranges as the core, and with free prices as the supplement.

III. We Should Have A Clear Understanding of the Relaxation of Control and the Control over Prices and of Flexible and Stable Prices

Along with the switch from the rigid model of price system to the new model of price system full of vitality, people must also radically change their ideological concepts and accept the concept of planned commodity economy. Here, I am going to talk about two points of understanding related to the model of price system.

1. Relaxation and imposition of price control

In implementing the model with floating prices as the core, we must relax our control over prices. For floating prices, the state only stipulates some benchmarks for the prices and the planned ranges for price fluctuation. The actual prices are to be decided by enterprises on their own in the light of the changes in market situation. As for free prices, they are entirely regulated by market mechanism and decided by enterprises on their own. Relaxation of control means the gradual reduction of the scope of the state's unified prices, the decontrol of prices, the enlargement of the scope of floating and free prices and the expansion of the power of our enterprises in setting prices.

An opinion that most people agree with is that the relaxation of price control does not mean a total decontrol and that themore the relaxation of price control, the reater the necessity to intensify our administration. This goes without saying. However, what is worth profound thinking is that in our real economic life, as soon as we relax our control over prices, a situation difficult to control will emerge and there will even be the unhealthy practice of unauthorized price hikes. Some comrades put the blame on the relaxation of price control and uphold a reversal of the practice. Does this not mean the return to the old practice of "confusion emerges as soon as control is imposed?" I think that the problem does not lie in the relaxation of price control. In order to bring into play the regulatory functions of price, we must relax price control. This is indispensable for the reform in our price administration system. At the same time, just as mentioned before, it is also inevitable that giving play to the functions of price will have the dual effect of invigorating enterprises and giving rise to some blindness. The crux of the problem is our administration. What kind of administration can enable prices to invigorate our enterprises and at the same time give rise to little or no blindness? This is a kind of art of administration, a kind of art that we are not familiar with. We are only familiar with the rigid and direct control and administration over prices that we conducted for many years. In people's minds, the concept of control, in fact, is the previous direct control and administration over prices. If we act according to this old concept, we will certainly pit relaxation of price control against price administration and it will be impossible for us to avoid repeating the old cycle of "confusion emerges as soon as control is relaxed and rigidity emerges as soon as control is imposed." Obviously, this does not meet the requirements resulting from the development of our socialist planned commodity economy or to the need to set up a new price administration system. We should have a new understanding of price administration and must radically change our concept. The "CPC Central Committee's Proposal on the Formulation of the Seventh 5-Year Plan for National Economic and Social Development" says: "The state's administration over enterprises will gradually switch from mainly imposing a direct control to mainly exercising an indirect control." Correspondingly, the state's administration over prices should also necessarily and gradually switch from mainly imposing a direct control and administration to mainly exercising an indirect control and administration. This requires that we must foster the concept of exercising indirect macroeconomic control and administration over prices and learn a new skill of indirect control and administration. Relaxation of price control does not correspond to direct control over prices, but corresponds to indirect control over prices. In relaxing price control and allowing prices to vary, we do not entirely decontrol prices, but make prices change along a normal orbit and sensitively respond to the changes in the planned commodity market. By so doing, the more we intensify our indirect macroeconomic control and administration over prices, the better the microeconomic relaxation of price control is facilitated. In the process of relaxing price control and allowing prices to vary, we will intensify our indirect macroeconomic control and administration over prices, really manage to organically unify price control and relaxation of price control and really become able to avoid rigidity when imposing control and to avoid confusion when relaxing control.

How should we indirectly control prices? What can we control if we do not directly interfere with the setting of prices? People are often perplexed by these questions. One viewpoint holds that the state's indirect price control means only a control over the general price level. As for the prices for various commodities, it should allow them to be set spontaneously by the market. I think that this understanding of indirect control fails to view the issue in totality. The "Resolution" points out: "Prices are the most effective regulatory means." If the state only controls the general price level and allows the specific prices of various commodities to vary entirely spontaneously, then this actually means that the state gives up its most effective means of regulation by prices. I think that the state's indirect control over the prices that it has relaxed control over, should consist of the following two aspects. On the one hand, the state should control the general price level through controlling the balance between total supply and demand and through controlling the restrictive factors such as the volume of currency issued; on the other hand, the state should control the benchmark prices and ranges of fluctuation for the prices of most important commodities and thus consciously apply the regulatory means of price. Only a few unimportant commodities can have free prices over which there is no control at all. The state should give guidance to, and exercise its influence even over free prices. In so doing, it can conduct necessary administrative intervention. Of course, it is very difficult to exercise indirect macroeconomic control and we lack experience in this sphere, therefore, it is necessary to probe into the way to do so. I think that in probing into the way to impose macroeconomic control, we can do the following: For example: 1) In order to give play to the regulatory functions of price, we should control the general price level and the range of fluctuation for various prices and make comprehensive and coordinated application of price and other economic levers; 2) on the basis of summing up our experience in implementing the policy of direct price control, we should study and draw up new price policies for indirect macroeconomic control and administration over prices; 3) we should satisfactorily do the work related to price information and forecast, provide price advisory service and correctly guide enterprises in setting prices and making decisions related to prices; 4) we should provide a satisfactory environment for the relaxation of price control, for example, we should straighten out our economy, expand our commodity market, control total social demand, and create environment for competition between our enterprises; and 5) we should perfect our legislation related prices, intensify price examination and supervision and thus ensure that the relaxation of price control and the practice of allowing prices to very [word indistinct] along the orientation of the development of the socialist planned commodity economy. Indirect macroeconomic control and microeconomic relaxation of price control coordinate with and are suited to each other. If we relax our price control before we have sufficient necessary measures to indirectly control prices, there will inevitably be a failure to exercise macroeconomic control over prices.

2. Flexibility and stability of prices

Relaxing price control while exercising an indirect macroeconomic control over prices will enable our prices to reflect changes in our markets and fluctuate around the value. The nature of the fluctuation of prices means its "flexibility," and is also its most prominent characteristic. Even the socialist planned prices are no exception. It is a misunderstanding to regard prices as fixed and unchanged. The factors that determine prices such as value and supply and demand relations always change; therefore, we cannot but allow our prices to fluctuate flexibly. If we deny the fluctuation of prices, it will be impossible for the law of value to play its role of regulation. Only "through the fluctuation of commodity prices can the law of value governing commodity production be implemented and can the thesis that socially necessary labor time determines commodity value become reality." (Footnote 2) (Engels: "Marx and Johann K. Rodbertus. Preface to the German Version of 'Poverty of Philosophy,'" "Collected Works of Marx and Engles," vol 21, p 215) The previous practice of fixing prices, unchanged for a long time, precisely reflected the rigid model of price system. Just as the "Resolution" points out, the reform in the model of price system that we are carrying out is precisely aimed at "enabling prices to relatively sensitively reflect the changes in social labor productivity and to relatively satisfactorily meet the demand of the national economic development." At the same time, we should also clearly see that under our socialist conditions, there should also be a stability in our prices. This is necessary for the socialist system in stabilizing its market and its people's livelihood and thus enabling its society and economy to develop steadily. We should provide a real possibility for socialist publicly-owned economy to stabilize prices through its macroeconomic control. The unity between the fluctuation and stability of prices is unique important characteristic of socialist prices.

For a long time, people have set the fluctuation of prices against their stability, in other words, set price "flexibility" against price "stability." Some comrades think that if we relax our control over prices, it will be impossible for prices to stabilize and that if we want to maintain stable prices, we must freeze prices of materials and goods and we should not relax our control over prices. In spite of our many years of repeated propaganda that stable prices do not mean frozen prices, in people's minds, they in fact continue to regard price stability as prices being unchanged and frozen. What is the reason for this? I think that this is mainly because we confuse the two different concepts in regard to the things which the flexibility and stability of prices refer to. The fluctuation or flexibility of prices refers to the price levels of specific commodities and is the characteristic of prices that fluctuate to reflect changes in the market. The stability of prices refers to the general price level and is the basic stable trend of the general price level while the rises and falls of the prices of specific commodities offset one another. The two are closely related and supplement each other. The fluctuation of the prices of specific commodities needs the stability of the general price level is not stable, the fluctuation in the prices of specific commodities will lead to economic disorder. The stability of the general price level, on the other hand, must be based on the rational fluctuation of the prices of specific commodities in order to maintain a rational price structure. If our price structure is not rational, it will be difficult for the general price level to stabilize and it will be detrimental to giving play to the functions of price as an economic lever. However, the economic conditions that determine the stability and flexibility of prices are different. The fluctuation of specific prices is mainly determined by the changes in the value of the commodity and in the supply and demand relations; while the stability of the general price level is mainly determined by equilibrium between the volume of supply of commodities and the social purchasing power and the balance between total social supply and demand. From the above, we can see that maintaining the stability of the general price level is by no means a task for a single price administration department. It is not difficult to imagine that if our macroeconomy grows out of control, and if there is an overexpansion of social consumption funds and investment in fixed assets, then it is impossible for a price administration department to control and stabilize the general price level alone. Freezing the price of a specific commodity is only a temporary measure and should not be regarded as a law for price administration work. The effect of even applying a measure to freeze prices is restricted to state-owned enterprises only. It is impossible to freeze the prices in collective and individual units. At the same time, it is necessary to grant financial subsidies in freezing prices. This often means paying the price of allocating subsidies to obtain price stability on the surface. In essence, this means a "covert inflation." Moreover, it is too heavy a burden for our finance, if it is to be maintained for a long time. Therefore, it is unjust to lay the blame for the instability of the general price level entirely on our price administration department and call our administration of commodity prices "price hike administration." In order to maintain a stable general price level, we must satisfactorily do the work to strike a comprehensive macroeconomic balance, which is the consequence of the harmonized coordination of various departments of our national economy in making joint efforts to intensify macroeconomic control.

Will the reform in our price structure give rise to a rising trend to prices? This is a practical question that people are very much concerned about and have relatively frequently discussed. During the reform, we must maintain a basically stable general price level. Under normal conditions, if a comprehensive balance is struck through macroeconomic control, mostly, it will be relatively easy to maintain a basically stable general price level. However, what we are doing now is to reform our irrational price structure; therefore, whether the general price level will rise is determined by the degree of irrationality in our price structure that needs to be readjusted. We should not be satisfied with making theoretical forecasts but must make practical estimates. If price reduction is greater than price increase in our price readjustment, naturally, the general price level will not rise. Owing to the problems related to prices that have been left over by history, the prices of our mineral products and raw materials are generally low, the purchase prices of major agricultural and sideline products are higher than the sale prices, and the products of the processing manufacturing industry are generally too high. It is necessary to readjust two categories of goods of low prices and reduce the high prices of one category of goods in our price structure; therefore, our rough calculation shows that even if there is no inflation, the reduction in the prices of one category of goods is not enough to offset the rises in the prices of two categories of goods and that a fairly large range of rise in the general price level is unavoidable. Looking squarely at the possibility of rise in general price level after price readjustment does not mean that we encourage price hikes, but means that we should be mentally prepared for the rise and earnestly find ways to maintain a basically stable general price level during our reform. This determines that in carrying out the reform in our country's price structure, we should not finish the price readjustment at one stroke, but we must divide up the task into several parts and do only a part of the task in each year. By so doing we will be able to avoid the social turbulence that may be caused by the price readjustment. Therefore, we should pay attention to studying the following: 1) We should make an estimated calculation of the rate of increase in our general price level that may be caused by the planned price readjustment for each of the coming years, and strive to control the rate within the range allowed by the necessity to maintain a basically stable general price level. According to our past experience, generally, it should be controlled within the range of 2-3 percent, but for some specific years, it should not exceed 5 percent. In particular, it should not exceed the interest rate for bank deposits or the rate of wage increase in order to avoid causing economic disorder or instability in people's livelihood. 2) In carrying out each stage of price readjustment, we should fully consider the capacity of the state finance to bear it, the capacity of our enterprises to absorb the increase in costs, and the capacity of the masses of people to endure it. We should do our best to avoid a widespread chain reaction that may be caused by the price readjustment that exceeds these capacities and that may thus give rise to universal rotational price rises. 2) We should create a satisfactory macroeconomic environment for our price reform, strive to strike a comprehensive balance for our national economy, control the volume of issuance and injection of money, and prevent any instability in the value of our currency from affecting the stability in our general price level during our price reform.

The range of increase in our general price level in each of these years that we are to control, is not the range of change in the prices of some specific commodities, but is the average change in our general price level as a whole. Therefore, during the reform in our price structure, while controlling the general price level within the range allowed, we should allow the prices of specific commodities to rise or fall in order to reflect the changes in our market. We should not view the changes in the prices of specific commodities during our price reform with the old idea of freezing prices and thus regard any increase in price as price instability. How can we reform our irrational price structure if none of the prices of specific commodities is allowed to change? Here the following two issues are worth studying and handling. 1) The issue to draw a clear demarcation line between rational and irrational price increases. As our price structure is irrational, the prices of some commodities should rise. These rises are rational and necessary for the reform in our price structure. But we should strictly forbid the practice structure. As for the practice of taking advantage of the reform to pushing up prices at will or in disguise, or even the practice of producing fake medicine and goods and pushing up prices indiscriminately, they are illegal practices and must be punished by law. 2) We should satisfactorily combine price readjustment with relaxation of price control. In regulating our prices, readjustment means changing our prices consciously in a planned manner; while relaxation means allowing prices to be regulated by market mechanism itself. We should not adopt a laissez faire attitude toward the prices over which we have relaxed our control and thus allow an irrational disparity between listed and market prices. For important commodities, we should set planned ranges to restrict the fluctuation in prices, and thus control the fluctuation within the scope that the state, enterprises, and masses of people can endure. As for the prices on which we have lifted our control and allowed to change freely, under the situation of a serious shortage of certain materials and goods, we should fix a ceiling for the prices. If we entirely abandon our control over these prices, we will not be able to maintain a basically stable general price level.

WANG JUN ON 1986 ECONOMIC, SOCIAL DEVELOPMENT PLAN

SK070041 Beijing BEIJING RIBAO in Chinese 26 May 86 pp 2-3

["Excerpts" of the report on the 1986 Beijing Municipal Economic and Social Development Draft Plan given by Wang Jun, chairman of the Beijing Municipal Planning Commission, at the Fifth Session of the Eighth Beijing Municipal People's Congress on 14 May]

[Text] Fellow deputies:

Entrusted by the municipal government, I now submit a draft plan on the 1986 Beijing Municipal economic and social development to the present session.

Based on our country's Seventh 5-Year Plan and the plan for 1986 adopted at the Fourth Session of the Sixth NPC, the basic tasks of the 1986 Beijing Municipal economic and social development plan are: Continue to implement the guidelines of the "four directives" given by the CPC Central Committee Secretariat, and the "10 instructions" given the CPC Central Committee and the State Council; do a good job in consolidating, digesting, supplementing, and improving the economic structural reform in accordance with the unified plan of the central authorities; strictly control the scope of investment in fixed assets; guard against the excessive growth of consumption funds; keep production at a proper growth rate on the premise of raising economic results; strive to strengthen and improve macroeconomic management; maintain a basic balance in finance, credits, materials, and foreign exchange; and develop the municipality's economic and social undertakings in a sustained, steady, and coordinated manner.

Under the draft plan, the total product of society should be valued at 51 billion yuan, up 5.8 percent over last year; the national income should be 20.5 billion yuan, up 5.7 percent over last year; the gross domestic product should be valued at 27.5 billion yuan, up 7 percent; and the total industrial and agricultural output value should be 37.2 billion yuan, up 6.4 percent.

1. The Agricultural Sector Should Promote an Overall Development in the Rural Economy Under the Premise of Stabilizing the Grain Output

The suburban areas should continue to implement the principle of "serving the capital, making the peasants prosperous, and building a new modernized socialist countryside," readjust the production setups in a planned and step-to-step manner, develop diversified undertakings, reform and improve the circulation system, and establish more stable nonstaple food bases in line with the requirements of making them become more and more specialized, commercialized, and modernized. Under the draft plan, the total industrial and agricultural output value of the suburban areas should be 8.09 billion yuan, an increase of 10 percent over the previous year; the output of grain should be 2 million tons (4 billion jin), that of milk, 140,000 tons (280 million jin), and that of eggs sold as commodities, 120,000 tons (240 million jin). The purchase of hogs should be 1.7 million head and the output of meat chicken should be 6.5 million. The volume of fish should be 17,500 tons (35 million jin) and the output of dried and fresh fruits should be 195,000 tons (390 million jin).

In order to stabilize grain output, and to properly increase funds for agricultural production and construction, we should increase the amount of subsidies for supporting agricultural production. All districts and counties should conscientiously implement the prinicple of operating rural industrial enterprises in order to support agricultural production, and lead the peasants in increasing their investments in agriculture. The grain farming areas should be relatively stabilized.

It is necessary to adopt measures to strictly prevent the areas of grain fields from being excessively reduced. We should strengthen the work of carrying out scientific research in the agricultural sector and of popularizing technology, raise the proportion of fine grain strains, apply more fertilizer to the fields, and strive to raise the per-unit area yield.

We should continue to implement the policy that agricultural production must serve the urban areas, and strengthen the building of nonstaple food producing bases. Vegetable production and supplies should be mainly carried out by the suburban areas, supplemented by the outer suburbs, and regulated by other localities. In vegetable production, we should grasp three links well: First, we should ensure the vegetable farming acreage. The farming areas in the suburban areas should not be less than 170,000 mu and the outer suburbs should strive to make the vegetable farming acreage reach 40,000 mu. This is a basic measure for guaranteeing vegetable output. Second, we should conscientiously implement the vegetable production and marketing contracts which should be strictly honored by peasants and commercial units. Third, we should resolutely implement the various government economic policies and regulations for developing vegetable production and guaranteeing vegetable supplies, and fully mobilize the enthusiasm of vegetable growers. In the meantime, commercial departments should strengthen cooperation with neighboring areas, establish vegetable production and supply bases, step up the purchases and transportation of the vegetables grown in other areas, and strive to make this year's vegetable production and supply better than those of last year. We should continue to greatly expand the production of milk, eggs, poultry, fresh-water fish, lean-meat hogs, and dried and fresh fruits, and satisfy the needs of the capital on a priority basis. We should also further reform and improve the farm and sideline product circulation system, set up direct links between producers and sellers, develop inter-regional joint operations and the new commercial departments joined by agricultural and industrial units, by agricultural and commercial units, accelerate the construction of farm and sideline product wholesale markets, and create better conditions for farm and sideline products to enter the urban areas.

Township enterprises of our municipality have witnessed great development over the past few years. This year, they should further consolidate themselves, strengthen management, expand lateral economic cooperation, and strive for better economic results. All districts and counties should decide on the orientation and major areas of development of their township enterprises on the basis of their own economic situation, natural resources, and market demands so as to avoid blind acts. At present, they should mainly engage in the processing of farm and sideline products, ore mining, the industries, commerce and service trades in support of large industrial enterprises, and the tertiary industry for pre- and post-production service. Departments in charge of various trades should give a helping hand and guidance to districts and counties in their planning for township enterprise development. Township enterprises should rely chiefly on their own accumulated funds and develop according to their capacities. Finance, tax, and banking departments should abide by relevant regulations and support the best enterprises on a priority basis. A portion of the increased income of township enterprises should be set aside to support crop farming, forestry, animal husbandry, and fisheries so that the economic benefits of various rural trades can be rationally distributed, and production in various fields can develop in a coordinated manner. Establishment of township industrial enterprises on the outskirt areas, in particular areas within the city proper, should be strictly controlled. Enterprises with funds and technologies in outskirt areas may move to outer suburbs to carry out joint operation. This year, the total income of township enterprises will exceed 6 billion yuan, an increase of 16 percent over last year.

Effective measures should be adopted to gradually change the faces of the 37 poverty-stricken villages in mountainous areas. All trades and professions, and all relevant districts and counties throughout the municipality should conscientiously implement the relevant resolutions and various policies and regulations of the municipal People's Congress Standing Committee and government, support their production and construction in a planned manner and according to established priorities with funds, materials and technology, and solve the current practical problems in drinking water supply, transportation, and afforestation as soon as possible. All poor villages should carry forward the spirit of self-reliance and arduous struggle, rely on their own efforts, and make the best use of their local resources to develop production, improve their living standards, and gradually change their poverty situation.

2. Industrial Production Should Be Focused on Improving Product Quality and Economic Results, and Should Be Increased in a Sustained and Stable Manner

According to the arrangements of the draft plan, 2.22 million tons of rolled steel, 8.89 million tons of coal, 2.59 million tons of cement, 56,000 vehicles, 800,000 television sets (including 400,000 color sets), 210,000 refrigerators, and 700,000 washing machines will be produced. The railway freight volume will reach 29 to 29.4 million tons, the road freight volume will reach 43.78 million tons, and the passenger volume of urban public transportation facilities will reach 3.28 billion people. The taxes and profits realized by industrial enterprises will increase by 6 percent, the per-capita productivity will rise by 5.5 percent, the energy consumption for per 10,000 yuan of industrial output value will drop by 5 percent, water consumption will drop by 6.5 percent, the steady improvement rate of product quality will maintain 90 percent, and the turnover of fixed-quota circulating funds will be speeded up by 3 percent.

The industrial departments should place their work of upgrading the quality of products and lowering the consumption of fuel, motive power, and raw materials on their important schedule. Efforts should be made to uphold the principle of regarding the work of improving product quality as a primary task and to earnestly implement the "provisions" published by the State Council with regard to enforcing the responsibility systems in improving industrial product quality. We should also enhance the management over 130 large plants that have consumed excess volume of power and 260 large plants that have consumed excess volume of water. The enterprises should conduct fixed-quota management over various consumptions, particularly over the consumption of energy resources and water. Efforts should be made to enforce the measure of progressively increasing the water and electric charges of those that have surpassed the fixed consumption quota. In distributing energy resources, water, and raw materials, efforts should be made to ensure the production of key enterprises, export commodities, fine-quality products, and products turned out with advanced technology in order to pledge to fulfill the mandatory plan and the plan for turning out products to readjust markets. We should restrict the production of commodities that are low in quality and high in prices, enjoy slow sales, and consume large volume of energy resources and raw materials. We should also prevent the trend of not stressing economic results and of seeking output value and productive speed lopsidedly.

The industrial enterprises should further readjust product structure and make efforts to develop export commodities that can earn large volume of foreign exchanges and products that are fine in quality, in short supply on markets, and enjoy brisk sales. Efforts should be made to vigorously improve the quality and function of old products, to upgrade the standard of products, to promote product improvement and renewal, and to continuously increase the variety of new products. We should pay attention at all times to the changes of market demands and accelerate the pace of developing, studying, and manufacturing new products in order to continuously reinforce the ability of enterprises to meet an emergency. In 1986, we will develop 300 fine-quality products at or above the municipal level and will complete the trial-manufacture of 2,000 products, of which 1,000 trial-products will be put into production. We will enforce the encouragement policy among the enterprises that turn out fine-quality products, export products earning foreign exchanges, products in short supply in markets; and will give them preferential treatment in loans, transportation, prices, and tax drawback. We will not suspend or reduce at will the production of minor commodities needed by the people's livelihood and should give preferential treatment to such production in raw material supply and in economic policies.

Efforts should be made to enhance technical renovations among the enterprises and to follow the road of expanding reproduction with the work emphasis of tapping latent power. A good job should be done in conducting the work of digesting imported technology, creating something new from it, and of turning out domestic technology by having the 34 large and middle-sized backbone enterprises covered by the state plan and 23 enterprises that have assumed the task of earning foreign exchanges by exports imitate it. Efforts should be made to vigorously increase investment results in order to pledge to complete the technical renovations of the state 17 key projects and the 130 municipal projects and to put all projects into production in line with the plan.

3. We Should Realistically Make Good Arrangements for Capital Market Supplies in Order To Vigorously Meet the Increasing Need of the People's Livelihood.

In line with the arrangement set forth by the draft plan, the total retail sales of the municipal will reach 14.5 billion yuan, a 13.7 percent increase over the 1985 figure. In order to meet the need of improving the people's livelihood, the industrial departments should assuredly fulfill the plans for turning out 40 commodities that enjoy brisk sales and in short supply and 60 minor daily commodities and for supplying commodities. The agricultural production departments should vigorously increase the output of farm and sideline products and earnestly implement the contract system of fixed-quota grain purchase. The commercial departments should continuously conduct reforms in circulation systems and open the gate of the capital in order to organize commodity sources in a multiple way and to further enliven commodity circulation. Efforts should be made to vigorously establish transregional and transdepartmental lateral economic associations; to consolidate the existing channels of commodity sources through joint-venture business, joint-sale operation, and technical coordination; and to develop new commodity bases. The state commercial enterprises should grasp a large volume of commodities in short supply and the important consumer goods, and actively join in the operation of regulating markets. In order to improve the supply of vegetables closely related to the people's livelihood, the agricultural and commercial departments should make concerted efforts in conducting vegetable production and supply in a balance way; ensure the inner suburbs to provide 575,000 tons (1.15 billion jin) of vegetables, outer suburbs to provide 100,000 tons (200 million jin) of vegetables, and outside cities to sell 200,000 tons (400 million jin) of vegetables to the municipality; and should urge the state commercial departments to grasp the major vegetable sources and to play a guiding role in order to ensure vegetable supplies, to maintain stable prices, and to achieve lower price trend.

We should continue to exert vigorous efforts to develop industries directly related to the people's livelihood, including the commercial, catering, service, and repair industries. We should continue to implement the principle of encouraging the state, collective, and private enterprises to participate in the work and urban and rural areas to grasp the work, conscientiously implement the various policies and measures set forth in the Document No 1 issued by the municipal CPC Committee, extensively mobilize the enthusiasm from all quarters, ensure that this year's new service units will increase by 15,000, strive to rationally distribute these units, and develop a group of markets and wholesale markets for farm products. We should further strengthen management over the commercial, catering, service, and repair trades, reduce circulation expenses, and raise economic results. We should also vigorously promote the practice of treating customers politely and doing business in a civilized manner, realistically improve service attitude, and raise service quality. At present, we should adopt measures to resolutely check the unhealthy trend of tie-in selling that harms the interests of the consumers.

4. We Should Vigorously Develop Foreign Trade and Tourism and Increase Foreign Exchange Earnings

Under the draft plan, the foreign exchange earnings from foreign trade should reach $645 million, and that from tourism $400 million (with plans to receive 1.2 million tourists), showing an increase respectively over last year.

The industrial, agricultural, and foreign trade departments should closely cooperate with one another, provide more quality and competitive export commodities of low prices, and start establishing a stable export production system. We should strive to expand the export of industrial goods, particularly the export of machinery and electronics products. Enterprises producing export commodities should resolutely implement the various economic policies of the State Council and the municipal government that encourage exports. Foreign trade enterprises should promote the economic contract responsibility system, improve the methods of giving awards and punishment, and further spark the enthusiasm of workers in operation. If contradictions between sales on the domestic and foreign markets arise, we should reduce the quantity of commodities for domestic markets, except for those that are related to the livelihood of the people, in order to ensure export. We should promote the sales of export products, continue to open up new world markets, establish and improve market networks, and pay attention to establishing some service centers in foreign countries on a trial basis.

The transaction of technological import is planned to be $100 million, which should be mainly on the technological transformation of enterprises producing export production and on the domesticization of key products. We should pay attention to implementing the contracts on 203 technological import projects that have already been signed and carrying out some supporting work.

The building of tourist facilities should be vigorously strengthened. Under the plan, we should increase some 3,000 hotel rooms for foreigners. The civil aviation and railway sectors should tap potentials and strive to increase the capacity for passenger transport. We should speed up the establishment of tourist spots and the building of the under construction projects, including Shihua cavern, Yunju temple, Shidu, Tuanhe imperial palace for short stays, Shijingshan amusement park, and the Changcheng museum in [name indistinct], start building the second-phase supporting project of repairing the Great Wall in Mutian Valley, and the new scenic spots along Guangou. Meanwhile, we should develop a series of commodities for tourists and train tourist personnel in order to raise the comprehensive tourist reception capacity and the service level.

5. We Should Conscientiously Implement the Decision of the Central Authorities on Reforming the Scientific, Technological, and Educational Systems, and Develop Scientific, Educational, Cultural, Public Health, and Sports Undertakings

We should continue to reform the scientific research structure, strengthen management over spadework, establish and improve all responsibility systems.

Further efforts should be made to display the scientific and technological superiority of the capital, encourage lateral cooperation among the scientific research departments, and between the research and production departments, display the role of technological markets, promote the transfer of scientific research findings to the production sphere, and organize scientific and technical workers to tackle the technical problems concerning economic construction and social development. Meanwhile, we should pay attention to developing new and high technology. Major areas of this year's scientific research plan include: 1) Development of new technologies and new materials; 2) successful popularization and application of computers, and improvement of the quality of efficiency of managerial work; 3) development of a number of scientific research projects which yield better and faster returns with concentrated efforts, and turning them into productive forces rapidly; and 4) development of a number of soft scientific projects to provide scientific data for the strategies of Beijing's economic, social, and scientific and technological development. This year, we should grasp well 81 projects covered by the municipal-level scientific and technological plan and, in particular, concentrate efforts on and make a success of the 14 coordinated technological research projects, such as water conservation, development of lean-meet hogs and milk industry, and development of fire alarm systems. We should organize the implementation of our municipality's "spark plan," widely apply the 10 coordinated technologies, and set up 30 model township enterprises which have their own characteristics.

In education, we should conscientiously implement the principle of comprehensive moral, intellectual and aesthetic education, and physical culture, and strive to improve the quality of instruction. According to the arrangements of the draft plan, this year municipal ordinary higher educational institutions will enroll 9,455 students, secondary specialized schools 10,000 students, ordinary senior middle schools 30,000 students, vocational senior middle schools 10,000 students, and skilled worker schools 7,500 students. We should further rationalize the educational structure, provide more favorabel conditions for running schools, and fully arouse the initiative of all quarters to run schools of various specifications at various levels with various measures. We should intensify the training of teachers, and accelerate the construction of teachers' training institutions. We should earnestly pay attention to the 9-year compulsory education, continue to restructure the secondary education, develop vocational and technical education, and, at the same time, do a good job in encouraging junior middle school graduates to enroll in schools other than ordinary senior middle schools. We should develop various types of adult higher education and secondary specialized education steadily, and make sure that their scopes are appropriate; their specialities suit the needs; and their quality is good. Ordinary higher education should be developed steadily in the course of reform, its quality should be emphasized, its structure of specialties and level of schooling should be readjusted, and enrollment should be conducted in strict accordance with state plan. Job distribution for college graduates should be further reformed so that they can be used rationally. We should organize and mobilize forces from all quarters of society to run nurseries and kindergartens well, and enable more children to attend preschools.

During the Seventh 5-Year Plan period, the number of primary school students will reach a peak, and school buildings and teachers will be in serious shortage.

The municipal CPC Committee and government attach great importance to this, and have ordered relevant departments to work out ways to solve this problem. After study, it has been decided that the unified construction of small-scale school buildings should be expedited in addition to making the best use of the existing school buildings, and increasing the number of students per class. The municipality as well as all districts should allocate special funds for the primary schools whose buildings are old and shabby but can be repaired to renovate and expand their buildings, and primary school buildings occupied by noneducational departments should be returned within a definite time. The above-mentioned measures should be fulfilled mainly by districts, which will be actively coordinated by relevant municipal departments. It is anticipated that the serious shortage of school buildings can practically be alleviated through hard work. Corresponding measures are also being carried out one by one to stabilize the teachers' contingents of primary and middle schools, expand the supply of teachers, and improve their competence.

We should continue to implement the various measures of the municipal government for educational development, and encourage the entire society to show concern for and support education, in particular the education in mountainous areas. The education funds will increase by 13.4 percent over last year, which is higher than the increase in revenue.

In health work, we should conscientiously do a good job in the prevention and treatment of contagious diseases, strengthen the supervision over good sanitation, attend to child care and immunity, improve the responsibility system for maternity care, perfect the urban and rural three-level prevention and protection network, and combine Chinese traditional medicine with Western medicine more successfully. We should continue to strengthen the construction of medical facilities. The plan arranges that the number of sickbeds will increase by 1,100 throughout the municipality, and family-based sickbeds should also be increased. We should intensify the training of specialized health workers, and concentrate efforts to run successfully the Shoudu Medical College, the Chinese traditional medical and pharmaceutical college, and a number of health and nurse schools. We should improve service attitude, and upgrade the quality of medical care.

We should continuously bring the population growth under control. By no means should we relax our vigilance in conducting family planning work. The municipality plans to achieve a natural population growth rate of 9 per thousand, to further bring under control the mechanical growth of population, and to maintain less than 9.71 million permanent residents by the end of 1986.

We should continuously do a good job in grasping undertakings in the fields of culture, physical culture and sports, broadcasting, and publication and in enhancing the building of cultural halls and libraries in districts and counties, with efforts to build 10 cultural halls and libraries in these localities. The publishing and printing industries should accelerate their pace in conducting technical renovations. In the field of physical culture and sports, efforts should be made to pay attention to or strengthen sports development among middle and primary schools, to conduct the work to develop spare-time sports schools, and, on the basis of extensively carrying out mass sports activities, to continuously upgrade the standard of the outstanding sports teams. We should uphold social benefit as a highest guiding principle in conducting radio and television station on a trial basis in the latter half of this year. Efforts should be made to continuously restore the places of cultural and historical interest, such as Dazhong temple, Wanshou temple, Shisan tomb, Xiannong temple, and Taishui temple, and to step up building the monument for the martyrs of the war of resistance against Japan.

6. We Should Enhance Environmental Construction and Do a Good Job in Greening, Beautifying, and Purifying the Capital

The municipal government has made special arrangements for the 1986 work of environmental protection and decided to successfully carry out 12 practical deeds for the people. Efforts should be made to implement the principle of consolidating public security in a comprehensive way in specific districts and to concentrate on controlling water pollution and pollution caused by gas, garbage, and noise. The major projects of comprehensive consolidation include the repair of the West Changan street area and the Beijing stadium area and the controlling of the water channels along the Yongding He, the polluted section of the Hucheng He at Sibian Gate, and the Yudai He in Tongxian County. The municipality also plans to build eight small beautiful residential areas, including the Sanlihe District in the west suburb, the eastern Taintan District, and the eastern Qingnianhu District; to develop 1.2 million square meters of heating supply network; to deal with 70 pollution sources, including plants (workshops) that have seriously interfered with the people's livelihood; and to build sewage treatment plants among the 15 hospitals. We will have Miyun County take up the pilot work of protecting the ecological balance and potable water sources. Efforts should be made to control the pollution caused by motor vehicle gas and noise, to prevent tractors from going through the areas around the Sanhuan road, and to set up additional automatic stations in charge of surveying or supervising the gas pollution from the Capital Iron and Steel Company and the Yanjing Chemical Plant.

In greening the city, the municipality plans to plant 300,000 mu of trees; to plant 15 million trees around houses and along rivers, roads, and ditches; to plant 1.2 million trees in urban areas; to lay 1 million square meters of lawn; and to plant 250,000 flowers along the urban main streets. Districts and counties should make efforts to build parks, to green their roads and small residential areas, and to build a large number of garden-style villages. A good job should be done in formulating the plans for greening the highways between Beijing and Miyun County and between Beijing and Zhoukoudian and for building the green belt along the outer suburbs, and in beginning to green some areas and sections in line with the plans.

7. We Should Bring Under Strict Control the Scope of Capital Construction and Ensure the Construction of Key Projects

During the first 2 years of the Seventh 5-Year Plan period, the municipality will maintain the standard of investment in fixed assets that was scored in 1985.

The 1986 municipal principle for making arrangements for local capital construction is to ensure the projects that can be completed within the year; to make arrangements, to the greatest extent possible, for the continuous projects having the necessary conditions; and to bring under strict control the new construction projects.

In line with the state investment in capital construction among the local public-owned units in the municipality and the investment in capital construction of the collective-owned units, and in line with the investment not covered by state restriction, the municipality plans to generally maintain in its draft plan for the scope of investment in capital construction the standard that was scored in 1985.

The arrangement for investment in some major local departments should be as follows:

We should continue to place the construction of the urban infrastructure above all other construction projects and the planned investment in this field should account for more than a half of the capital construction investment arranged by the municipality's local financial department. Such investment should be used mainly for building water and gas supply projects and roads in the urban areas. Regarding the water supply, we should complete the reconstruction projects of the Chengzi water works and the Beiwu water pumping station, start building the No 9 Shuiyuan water works, and tap the potential of the No 8 Shuiyuan water works. As regards the gas supply, we should mainly build natural gas supply, storage, and pressure regulation stations; grasp the projects of moving and overhauling the furnaces of the coking plant in order to increase gas supply; and strive to equip the plant with over-type furnaces by the end of the year. Furthermore, we should fulfill the task of laying gas pipes and installing gas stoves for 60,000 households, and basically complete the construction of the gas tank plant. Concerning heating supply, we should complete the second-phase construction of the Zuojiazhuang heating supply plant and start building spike boilers [jianfeng guolu 1423 1496 6938 3619] of the No 2 heating supply plant. In road construction, we should complete the construction of Yuquanshan road, Dongzhimenwai Street, the northern section of Anzhen road, Majiabao road, and the Dabeiyao overpass; begin the construction of Dongwaierhuan road (the section from Dongbianmen to Puhuangyu) and the supporting overpass project; and start improving and broadening Dongnansanhuan road (from Shuangjing to Muxiyuan). The municipal road maintenance department should also use the road maintenance funds to build part of the road sections of Jingshi road and Jingyu road, and the second-phase construction of Badaling road. In environmental hygiene, we should mainly arrange for the construction of seven garbage disposal yards. Proper arrangements should also be made for environmental protection, landscaping and afforestation, water conservation, and flood prevention, public transportation, car purchases, and the dismantling of houses to make room for urban construction projects. In addition, we should also coordinate with the post and telecommunications departments in fulfilling the plan for installing 60,000 telephone lines in the urban areas.

Under the plan, the educational department should complete the construction of the laboratory building land the student cafeteria of Beijing Engineering University, the library of the Agricultural Institute, and the school building of the No 2 branch of the People's University; continue the construction of the laboratory building of the teacher's training institute, the library of the economic institute, and the school building of the radio and television university; grasp the renovation and expansion projects of more than 20 primary and middle schools, including the No 4 Beijing middle school; and begin the construction of the Xizang middle school and Jingshan school.

The public health department should complete the construction of Longfu, Diliu, Xiaozhuang, and Guanzhuang hospitals and the municipal emergency center; continue the construction of Taintan, Huimin, Shijingshan hospitals; and start expanding Youyi, Ertong, and Tongren hospitals.

The scientific research, cultural, and sports departments should mainly build the Xiannongtan track and field stadium, the educational television station, the second-phase construction of a radio station, the printing plant of Beijing Ribao, warehouses for cultural relics, the laboratory building of the New Technology Institute, scientific and technological centers, and institutes for scientific and technical personnel to further their study.

Under the plan, the financial and trade departments should complete the construction of the Hepingli department store; build Qijiayuan commercial building, Dongsi people's market, Fuchengmen vegetable market, Fuxingmenwai comprehensive commercial center, and a few medium-sized commercial centers; continue the construction of a feed processing plant, the No 2 bean product plant, the Liubiju preserved vegetables plant, two meat cooperative plants in Haidian and Tongxian counties, vegetable storage facilities, and grain depots; and complete the construction of a group of support projects of the commercial units and the renovation of some houses and shops. As for hotels, we should mainly build seven joint-venture hotels, including the guest house attached to Beijing hotel and Heping guest house, and 23 hotels of average standard. Under the plan, we should complete the construction of some 5,000 guest rooms, 244 apartments, and 30 office buildings.

The political and legal departments should mainly build police academies, traffic command centers, social welfare institutes, child welfare institutes, hospitals for mental patients, and archives for courts.

The agricultural, forestry, and water conservancy departments should complete the construction of the Shisanling water diversion project and Yongding floor-control sluice gate, and establish Huadu meat cooperative plant, a dairy product processing plant, and a comprehensive commercial center for aquatic products.

The industrial departments should mainly build the Huadu brewery, Dongjia grape wine plant, refrigeration compressor plant, woolen silver plant, Yanshan cement plant, and other industrial projects that suit the characteristics of the capital.

In housing construction, construction of 6.7 million square meters has been locally arranged, of which most will be built with the funds collected by the user units themselves, and the rest is covered by construction plans. We plan to complete more than 2 million square meters, including 100,000 square meters of housing for primary and iddle school teachers, and 20,000 square meters for veteran cadres. In addition, special funds have been arranged for housing for retired army cadres, for the houses used in implementing the private house policy, and for renovating simple buildings.

After repeated study, the municipal government held that the above-mentioned arrangements conform to the state's demand for strictly controlling investment scale and also take the urgent needs of various fields into consideration. However, the construction scale is not small, and therefore construction forces will be very strained, building materials will fall short, and great efforts will be needed in completing the construction.

Construction projects should be properly arranged so that the scale of investment can be brought under control. Comprehensive balancing and rational arrangements should be conducted in line with the needs of the municipality and the possibility of local financial and material resources. All departments and units should take the overall situation into account, refrain from vying for more projects under construction, and pay close attention to their construction speed so that these projects can be completed and commissioned at an early date and yield results as soon as possible.

In order to ensure that this year's local capital construction scale is kept within the state-assigned quotas, we should adopt the following measures:

1) We should straighten things out with regard to the projects under construction. Projects that are not provided with necessary construction conditions and yield poor economic benefits should be suspended or postponed in order to guarantee the construction of necessary key projects.

2) We should bring new projects under strict control. Except for those with special approval, no projects should be started in principle. According to state stipulations, large and medium-sized projects should obtain the approval of the State Planning Commission before they can be started. No district, county or bureau (general company) is permitted to overstep its authority to examine and approve construction projects, nor is it permitted to exceed the investment scale set by higher levels. With regard to the projects that are examined and approved by the units which overstep their authority, relevant departments should not handle their planning, designing, and land requisition procedures, and should not issue construction licenses, and banks should not issue funds to them.

3) We should strengthen management of the capital construction funds raised by units themselves. Such funds should be examined by financial departments first to verify that they are collected through proper channels according to regulations, and should be deposited in construction banks for at least 6 months before they can be used. Bank loans and credit investment must not be regarded as self-raised funds. If the money deposited in banks is not sufficient, the planned investment quotas should be reduced accordingly. Funds deposited in other banks must not be used in capital construction.

4) We should go through all capital construction procedures when carrying out all capital construction projects. We should establish a strict system to

appraise projects. With regard to new projects, the reports on the feasibility study should be examined and appraised by consultation units entrusted by the municipal planning commission, and then examined and approved by the Municipal Planning Commission itself after it conducts comprehensive balancing. Only after this can we cover the new projects in our construction plans.

5) We should adopt the method of "investment responsibility." Projects provided with the conditions for adopting this method must not be started before the responsibility for their investment is fixed. Construction units should carry out conscientious consolidation, strive to improve the quality of construction, shorten the construction period, and must not ask the development units for any funds not related to the projects. In addition, the method of signing contracts to fix the amount of wages for every 100 yuan's worth of finished work should be improved. Designing units should strive to raise the quality of designing, actively serve consumers, and collect the designing charges in strict accordance with the regulations of the State Planning Commission.

8. We Should Strengthen and Improve the Macroeconomic Control, and Do a Good Job in Voerall Balancing

When strengthening and improving the macroeconomic control this year, we should carry out the following work successfully in addition to strictly controlling the investment in fixed assets and readjusting the investment pattern.

1) Efforts should be made to continuously bring under control the excess increase in consumer funds and to further enhance management over funds for urban staff members' and workers wages. We will no longer be able to increase the sum bearing a balance between the total wages of staff members and workers, and the total profits and taxes handed over by the enterprises. No unit is allowed to establish new allowances and other subsidies by using funds for rewards. Efforts should be made to strictly follow the state provisions in collecting taxes, giving rewards, or regulating wages from the state enterprises, establishments, and units. We should carry out consolidation and examination of the scale and total sum of tax reduction and exemption among the collective-owned and township- and town-run enterprises. Efforts should be made to resolutely curtail the institutional purchase power of organs, enterprises, establishments, and units and to strictly oppose extravagance and waste.

2) Efforts should be made to bring under strict control the scale of credits. The 1986 state plan for local credits shows a small increase over the 1985 target. Doing a good job in making use of these funds has a vital bearing on supporting industrial and agricultural production and enlivening commodity circulation. Banking units should make efforts to attract the people's deposits and to expand fund sources. Efforts should be made to actively set up centers and networks in charge of having the people open saving accounts and to encourage organs, organizations, enterprises, and units to accept deposits. In releasing circulation funds and loans, banks should deal with each case on merit, give support to those outstanding ones, and should readjust the fund surpluses and shortages in a timely manner. Specialized banks should subordinate their orientation and scale of loans for investment in fixed assets to

the state macroeconomic policy decisions; bring their loans not only in line with the state credit plan, but also with the plan for investment in fixed assets; and should by no means use loans for projects not covered by the plan. Efforts should be made to improve the accounting work of banks and to make things convenient for clients in order to accelerate fund circulation.

3) Efforts should be made to enhance the maintenance of the comprehensive balance among material sources and to do a good job in conducting the work of distributing materials. The 1986 state material distribution to local units generally maintains the standard scored over the past 2 years, and the supply of major materials for both production and construction is still short. Therefore, the municipal departments in charge of this work should adopt various ways and means to organize local material sources. In conducting distribution, we should first fulfill the demands of production covered by the mandatory plans and of the key construction projects, make preferential arrangements in raw material supply for the enterprises producing export commodities and products in short market supply, and should deal with other distributions chiefly through regulating markets. Production enterprises must ensure the fulfillment of the municipal plan for readjusting material supply volume and will not be allowed to conduct self-sales if they fail to fulfill the plan or the target set forth by the plan. Efforts should be made to conduct coordination in material supply and to exchange materials. Meanwhile, we should raise funds for building raw material supply bases among the areas endowed with abundant natural resources in order to further expand material sources. A good job should be done in continuously recovering or utilizing metal waste and resolutely fulfilling the task of handing over metal waste to the governments.

4) Efforts should be made to enhance management over foreign exchange. We should conduct centralized management over foreign exchange, conduct careful calculation, and should practice economy in using foreign exchange in line with the target set forth by the state. The areas with dense populations should use their retained foreign exchange chiefly for purchasing equipment and appliances urgently need by the departments of science, education, culture, and public health and for purchasing foreign raw materials needed for both production and construction. Efforts should be made to carry out strict approval for sending observation delegations abroad. A good job should be done in realistically adjusting the usage of foreign exchange in the municipality. In applying foreign loans, we should uphold the principle of paying back loans by those who have borrowed the loans, and earnestly pay attention to the domestic fund association and the domestic compensatory capability. It is imperative for us to follow the procedure of approval for applying for foreign loans and to control the sum within the fixed quota. No department or unit is allowed to sign a loan contract arbitrarily without approval.

5) Efforts should be made to enhance or improve the work to bring about harmony among macroeconomic management; to vigorously enhance the work undertaken by the comprehensive departments in planning affairs, financial affairs, tax affairs, banking affairs, audit affairs, statistical affairs, material supply, labor wages, and industrial and commercial administration; to establish the joint meeting system among these comprehensive departments; to better bring into play the function of the comprehensive economic administrative departments in bringing about harmony among macroeconomic management; and to fully apply

the measures for economic adjustment and supervision in order to ensure the fulfillment of the plan.

9. Conscientious Efforts Should Be Made To Carry Out This Year's Structural Reform Successfully

This year we should emphasize the following work:

1) We should continue the price and wage reforms.

Last year, substantial progress was achieved in price reform, and the results were better than expected. Although mistakes once appeared soon after the vegetable prices were decontrolled, progress was smooth in general. This year, no major measures for price reform will be put forth. However, the task to maintain basic stability in commodity prices remains very arduous. With regard to some destabilizing factors, we must never take them lightly. The key to controlling the overheated rises in commodity prices lies in stabilizing vegetable prices. The municipal government has made special study and arrangements. Agricultural and commercial departments should exert concerted efforts, further implement the various policies and measures encouraging vegetable fields are not misused, reform the vegetable production and marketing management system, develop straight-line circulation, and strive to reduce vegetable prices while maintaining their stability.

The wage reform of organs and institutions should be continued this year, and the system of designation for specialized and technical posts should also be gradually applied. After the coordinated reform of their wages, enterprises should adopt effective measures to further eliminate egalitarianism, and persistently carry out and improve their economic responsibility system to boost the enthusiasm of their cadres, and staff members and workers. In the meantime, we should conduct investigations on the problem of inordinately large differences between the wages of different members of society, and work out ways to solve this in line with the policies and regulations of the central authorities.

2) We should further invigorate enterprises, especially large and medium-sized ones, and enhance their capacity for transformation and development. We should follow the arrangements of the State Council to reduce in a planned manner the regulatory taxes from the large and medium-sized enterprises with heavy technical transformation tasks and high regulatory tax rates, and gradually raise their fixed asset depreciation rate. We should conduct an overall inspection on the implementation of the "Interim Regulations on Further Expanding the Decisionmaking Power of State Enterprises" issued by the State Council in 1984, and the municipal government's various policies on invigorating enterprises, conscientiously solve the problems existing in expanding the decisionmaking power, and truly delegate to the enterprises the power they are entitled to. We should firmly enforce the various forms of the economic responsibility system of having directors (managers) assume full responsibility and the personal production responsibility system of industrial enterprises, the operational responsibility system of foreign trade departments, the contract and leasing systems of small enterprises and the bidding system, and the method of

signing contracts to fix the amount of wages for every 100 yuan's worth of finished work enforced by construction enterprises, we should conscientiously improve them in line with the state's relevant regulations in order to solve the existing problems. The various forms of responsibility systems applied in the rural areas and other departments should also be carried out persistently and further improved and developed in the course of practice.

3) We should vigorously develop lateral economic cooperation. It is necessary to conscientiously implement the guidelines of the national economic structural reform work conference and the 30 regulations of the State Council on promoting lateral economic cooperation, formulate supplementary regulations and detailed rules for implementation in line with the situation in the municipality, and develop lateral economic cooperation in a planned and purposeful manner. First, we should actively organize lateral economic cooperation between the urban and rural areas and among various trades and departments and organize enterprises and economic associations through transferring the manufacturing of products to other localities, cooperatively developing plants, and establishing ties between the producers and traders and on the basis of voluntary participation, equality, and mutual benefits. Second, we should develop lateral economic ties with neighboring localities and increase the supply of nonstaple foodstuffs in the capital. Third, we should develop lateral economic ooperation with localities with rich natural resources in order to establish stable raw material supply bases for the industry of Beijing Municipality. Fourth, we should display the scientific and technological superiority of the capital, continue to [words indistinct] with various provinces, with various provinces, autonomous regions, and municipalities, and continue to do a good job in supporting their counterparts. Fifth, we should continue to adopt preferential policies, and welcome the fraternal provinces, autonomous regions, and municipal [word indistinct] to Beijing to jointly and independently run this tertiary industry that serves the people's livelihood.

4) We should continue to improve the planning and management system and strengthen management over the mandatory and guidance plans. In line with state demands, local authorities and departments should appropriately reduce the number of mandatory plans. We should properly balance and coordinate the production conditions for the mandatory plans. Enterprises undertaking the allocation tasks of those products subject to the mandatory plans should receive the order of goods in accordance with the plan and organize production according to the required varieties and patterns. Enterprises that cannot fulfill the contracts for ordering goods in line with the state plan will receive relatively fewer material allocations. We should strive to strengthen management over the guidance plan. The comprehensive economic departments should not only strengthen control over the macroeconomy but should also help enterprises vitalize the economy, fully use the economic levers, and lead them in fulfilling their tasks.

Fellow deputies,

The current political and economic situations of our municipality are very good. The scope of investment in fixed assets has been controlled in line with the state plan, and the growth rate of consumption funds has become normal. Markets are stable, the price index declines monthly, and foreign export trade has witnessed an upward trend, showing a fairly large increase over the same period of last year. The agricultural production situation is good, production of nonstaple foodstuffs continues to growth, and the development of township enterprises is quite rapid. Financial revenue and expenditure as well as bank loans and credits are normal. Urban and rural savings deposits have increased by a large margin, and the withdrawal of currency has exceeded that of the corresponding period of last year. Through adopting effective measures, industrial production has increased steadily. Although we still have many difficulties lying ahead of us and some problems which we must conscientiously overcome and solve, we are convinced that so long as the people throughout the municipality work in the unity under the encouragement of the guidelines of the Fourth Session of the Sixth NPC, persist in reform, and work diligently and in a down-to-earth manner, we will surely fulfill or overfulfill various tasks set forth in the draft plan for 1986 economic and social development, and make a good beginning for the implementation of the Seventh 5-Year Plan.

PROVINCIAL AFFAIRS

JIANGXI'S WAN SHAOFEN ANALYZES ECONOMIC SITUATION

OW270237 Nanchang Jiangxi Provincial Service in Mandarin 1000 GMT 23 Ma

[Excerpts] The provincial party committee held a meeting of prefectural and city party secretaries and commissioners and mayors from 12 to 17 to analyze Jiangxi's political and economic situation since the beginning of this year and make arrangements for future work. All localities were called upon to pay closer attention to the economic work and reform, build up leading bodies ideologically and organizationally with an aim to improving party style, and exert maximum efforts and devotion to score greater successes in the work of all fields this year.

Attending the meeting were prefectural and city party secretaries and commissioners and mayors, responsible comrades of the provincial party committee, the provincial Advisory Commission, the provincial Discipline Inspection Commission, the provincial People's Congress, the provincial government, the CPPCC provincial committee, and members of the CPC Central Committee, the Central Advisory Commission, and the Central Discipline Inspection Commission in Nanchang, as well as officials from provincial departments, commissions, offices, and bureaus concerned. In all some 140 people attended.

The meeting transmitted the central authorities' relevant documents and Comrade Hu Yaobang's recent important speeches. On the basis of studying these documents and speeches, responsible comrades from all prefectures and cities discussed views, measures, and suggestion related to the meeting's subjects.

Deputy secretary of the provincial party committee Liu Fangren, deputy secretary and Governor Ni Xiance, and deputy secretary Xu Qin respectively spoke on party building, the economic work, and rural work. Secretary of the provincial Discipline Inspection Commission Zhu Zhihong and vice governor (Sun Xianye) spoke on the strengthening of discipline inspection work and on circulation and the investment scale on capital construction respectively. Comrades Bai Dongcai, member of the Central Advisory Commission, and Zhao Zengyi, chairman of the provincial Advisory Commission, also spoke.

On behalf of the provincial CPC Standing Committee, Secretary Wan Shaofen gave a summary on the afternoon of 17 May. Analyzing the economic situation, Comrade Wan Shaofen noted that Jiangxi's economic situation in the past 4 months or so has been good. Industrial production has advanced at a relatively fast pace with a total output value topping the same period last year by 9.6 percent and ranking third among all provinces, municipalities, and autonomous regions in the country. The situation in agriculture has also been good, with all localities paying greater attention to grain production, building more irrigation works, appropriating more funds for agriculture, making earlier preparations for spring farming, planting larger areas of crops with fine seeds and strains, and exerting greater efforts at diversified management than last year. However, pressing problems that merit our keen attention remain. In industry, we see, first of all, a sluggish trend in the growth rate and, second, a decline in economic efficiency, inconsistent product quality, and a slowdown in the circulation of funds. In agriculture, problems are reflected in clogged circulation and poor service before, during, and after production. Besides, we have also failed to make adequate preparations ideologically and in materials regarding possible natural disasters this year. These problems have been caused by relaxing vigilance in our subjective thinking and objective factors such as shortages in electrical power supply, raw and semifinished materials, and funds.

After analyzing the economic situation, Comrade Wan Shaofen emphatically pointed out: As this year is the first year of the Seventh 5-Year Plan, we face an arduous task in the next 7 months or so. In the first 4 months, we have only fulfilled 27.3 percent of the targeted annual industrial output value, and are lagging quite behind the plan. We must face up to this grim reality, and motivate ourselves to reform persistently with one heart and one mind and to maximum efforts to overcome difficulties in order to pick up the growth rate in May and achieve a big increase in June to ensure the midpoint plan fulfillment and the complete fulfillment and overfulfillment of the annual plan.

In order to carry out the task, Wan Shaofen put forth the following four requirements for industry:

First, all localities, departments, and enterprises should realistically analyze the current production situation and take active and effective countermeasures by intensifying ideological and political work among enterprise cadres and workers, earnestly implementing the economic responsibility system, tapping potentials, and closely coordinating with power, banking, material, and railway departments in alleviating the current widespread strains on transportation and shortages of power supply, circulating funds, and raw and semifinished materials.

Second, it is necessary to successfully carry out reform and improve management in order to invigorate the enterprises.

Third, it is necessary to energetically promote lateral economic ties and absorb talented personnel, technology, funds, and equipment for exploiting Jiangxi's rich natural resources and transforming natural advantages into economic ones.

Fourth, it is necessary to firmly control the scale of investment on fixed assets and ensure the construction of key projects.

Turning to agriculture, Wan Shaofen said: In developing Jiangxi's rural economy, it is necessary to readjust the structure of agricultural production and promote commodity production. While sparing no effort at grain production, it is necessary to promote the rural economy as a whole by exploiting our mountain, river, farm, and mining resources and developing diversified undertakings and village and township enterprises. We should strive to build up our strength in these two fields to ensure a big increase in committees in rural areas and enable the peasants to become better off as quickly as possible. We should also unclog circulation, improve service, enforce contracts on grain purchases, and resolve the existing difficulty in selling hogs and possible problems in selling grains. It is necessary to set up and improve various kinds of service systems for peasants in rural areas.

The second part of Wan Shaofen's speech dealt with the necessity of improving leading bodies. She said: As all quarters throughout the province have paid keen attention to the question of party style, a new situation characterized by all party members endeavoring to improve party style has emerged. We have investigated and handled a number of major and serious cases, thereby enhancing the confidence of cadres and ordinary people in rectifying party style. Through the efforts by all people from the top down to the grass roots, we have basically checked or considerably weakened the unhealthy tendencies of giving extravagant dinners, party and government organs and leading cadres and their children setting up businesses, party members and cadres building houses in violation of discipline, and purchasing or trading expensive cars. There are specific examples of a marked improvement in party style in Jiangxi. The party style of leading bodies at all levels has also been further improved. Of course, problems and difficulties remain. First, the progress has been uneven. Some units with obvious problems have not yet taken action. Second, manifestations of unhealthy tendencies politically and ideologically and in work have not been thoroughly eliminated. We must concentrate our efforts for the next 2 years in earnestly rectifying the party style of leading bodies at and above the county level in accordance with the central authorities' instruction. Leading cadres at all levels should play an exemplary role in teaching their children, relatives, and subordinates.

The third party of Wan Shaofen's speech set specific demands regarding the ideological and political work among talented personnel and implementation of the policy toward intellectuals for consolidating and developing the political stability and unity, the political and judicial work, rural party rectification, production and traffic safety, arrangements for retired veteran cadres, and the study of development strategy, overall plans, and policy decisions.

Wan Shaofen said: The meeting was successful. It is hoped that through the meeting, we will foster healthy practices of assessing things as they are, doing more practical things, seeking concrete results, and stressing actual conditions, and, under the leadership of the CPC Central Committee, pool the wisdom and efforts of all, work with one heart and one mind, enhance unity, and endeavor to score greater successes in the work of all fields and fulfill the targets for this year.

ISSUES CONCERNING GUANGZHOU'S COOPERATION WITH FOREIGNERS

Guangzhou GUANGZHOU YANJIU (GUANGZHOU STUDIES) in Chinese No 5 Sep-Oct 85 pp 35-37

[Article by Yang Qinquan [2799 293 3123] and Jiang Zhiyuan [3068 0037 3293], Propaganda Department of the Guangzhou Municipal Party Committee: "Some Reflections on the Results of Foreign Economic Cooperation at Guangzhou and on Certain Tactics"]

[Excerpts] Opening up the country to the outside world is China's fundamental policy in the new historical period, in the course of which the question of how to use the form of state capitalism to promote a socialist construction poses undoubtedly a new theoretical problem. A thorough study of this problem will provide the necessary theoretical reference for all parts of the country in their further expansion of opening up to the outside world. The present article attempts to present some humble opinions with regard to the results of foreign economic cooperation at Guangzhou and on some relevant questions of strategy.

II.

In the actual practice of opening up toward the outside world, Guangzhou has been one of the most rapidly progressing cities of the entire country. From the end of 1978 to September 1984, Guangzhou signed 209 joint venture, cooperative ventures, and compensation trade agreements, involving investments totalling U.S.$610 million, of which $220 million of foreign capital have by now actually been used. The cooperative enterprises involved total close to 200. Using foreign capital and self-retained foreign exchange, Guangzhou imported more than 100 production lines, almost 10,000 sets of advanced equipment and a number of advanced technologies. The results of using the form of state capitalism in this manner in order to promote the economic and social development of Guangzhou have become evident in the following respects:

1. The acceleration of technological transformation and technological progress in enterprises which enabled them to attain the international technological standards of the late 1970's and the early 1980's in the production technology of certain products. Examples are such electronic products as minicomputers, microcomputers, electronic calculators, and electronic meters; such electric household appliances as washing machines, refrigerators, electric cookers,

tape recorders, and window air conditioning units; such foodstuffs as beverages in soft containers and fast-food noodles; such knitwear, textile, and plastic products as indigo fast-color woollen cloth, georgette, polyurethane synthetic leather, plastic floor covering, etc. These products fill gaps that existed in national and provincial production, most of them developing into new hot-selling products or top-rating products of Guangzhou.

2. The promotion of tourism. Since opening up in 1979, Guangzhou has used foreign capital to the amount of over $100 million for the construction of new hotels and for the renovation and reconstruction of existing hotels and some restaurants, among the larger ones being the White Swan Hotel, the Great China Hotel and the Park Hotel. For all these newly built or renovated hotels, the most advanced foreign equipment has been imported, some even installing computerized management, with the result that the hotels and restaurants have attained modern international standards, an important factor in attracting large numbers of foreign travelers and in the development of tourism.

3. The increase in commercial installations. By using foreign investments and self-retained foreign exchange, Guangzhou imported sets of advanced equipment and many technologies and built or renovated a number of stores and markets. The Haizhu and several other markets installed refrigerated shelves; more than ten commercial enterprises, among them the Nanfang Mansions, the Friendship Store, the Foreign Ships Supply Co. and the Huaxia Co., installed central air conditioning; among other items that were imported were such articles as computerized eye examination and eyeglass fitting equipment, contact lens fitting equipment, colored photo and developing equipment, and an automatic production line for bean curd, opening up new fields of service and consumption.

4. The promotion of agriculture and animal breeding. The importation of improved specimens of chicken, cattle, pigs and fish, and the simultaneous importation of several types of advanced feeding and animal raising equipment, induced a tendency toward modern mass production among the traditional animal husbandry establishments, and the percentage of marketable products markedly increased.

5. The promotion of new housing constructions. Up to the end of last year, 15 contracts were signed, involving foreign investments of $170 million, for the construction of apartment houses, of which 150,000 sq m have already been completed and taken in use. One part of the new apartments was allocated to foreign businessmen who sold them in Hong Kong, thereby recovering their investments and earning a profit. We on our part gained the following four benefits: (1) The apartments allocated to us were distributed to residents of Guangzhou, which helped to improve living conditions for a part of the population. (2) The state gained additional foreign exchange revenue; the completion of the entire cooperative engineering project can create $23 million. (3) Municipal installations in connection with the apartment houses, such as water and electric power supply, telecommunications, roads, etc. were correspondingly improved. (4) Auxiliary services for the livelihood of the people in the residential areas were newly started up, thereby providing additional employment opportunities.

6. The improvement of educational and health care conditions and in the promotion of scientific and technological research. Following the implementation of the open door policy, overseas Chinese and compatriots in Hong Kong and Macao collected and contributed a total of more than 28 million RMB for the extension or new construction of more than 80 schools. Some contributed funds for the construction of hospitals or the purchase of medical equipment. Some schools now use imported educational equipment for "electrified" instructions. Some hospitals use peritoneoscopes, automated instruments for hemopneumonic analyses, and other advanced medical equipment.

Moreover, owing to the open door policy, an additional 70,000 persons found employment. Many were able to acquire enterprise management skills from the experiences that had been gathered in foreign countries, and a large number of talents could be trained for foreign economic work.

III.

State capitalism under the conditions of the dictatorship of the proletariat is a form of capitalism that allows the state to impose restraints and regulate all activities. Use of foreign capital and importing technologies appears outwardly to be merely a barter of goods against goods, but actually it is also an exchange of persons with persons, and is, therefore, of important significance for a careful and effective handling of personnel. "Policy and tactics are the life of the party," and our policy of opening up the country has already been proven correct in actual practice. But as far as tactics are concerned many specific problems still exist in the course of our cooperation with foreign parties. As one of the earliest cities to practice the open door policy, Guangzhou has gained much insight in this respect, and this includes experiences and also lessons. In summary there are three relationships that must be effectively dealt with:

First, it is necessary to persist justly and forcefully on launching the normal "party, labor union and youth league" activities within the Chinese-foreign cooperative organizations, and to strive for understanding, support and sincere cooperation on the part of the foreign personnel. Personnel of foreign investors as a rule harbor some misgivings regarding such organizations as labor unions, and are even more apprehensive in this respect when they come to socialist China. The foreign personnel of some foreign cooperative enterprises in Guangzhou are afraid that our labor unions will start "labor trouble;" they also distrust our party members, while some party members, when completing the required forms, do not dare reveal their own political standing. However, turning our party from a party in power into an "underground party" will, on the contrary, make matters look mysterious in the eyes of the foreign personnel and easily lead to unnecessary misunderstandings. It will also impede our party members in playing their role of pioneers and models among the masses. In the opposite case, if proper propaganda will clearly explain to the foreigners the tasks and the role of the party within the cooperative enterprises, this will gradually resolve all their unnecessary apprehensions and will help create an overall situation of cheerful cooperation. For instance, there was one cooperative management enterprise where the Chinese personnel intended to use some work time to hold a party and youth league meeting to study more effective ways of working.

After explaining in advance the content and purpose of the meeting to the person in charge on the foreign side and obtaining his understanding and support, it was possible to have all personnel concerned from the various departments punctually attend the meeting. The responsible person on the foreign side cheerfully said: "I too would like to join you, but, unfortunately, I am not a party member." On the day of the meeting it happened that one party member of a certain department had his day off. The foreign manager of that department, however, specially sent someone to the said party member's home to notify him and have him come back to attend the meeting. As "all one's cards were laid on the table," the foreign personnel gained an increased understanding of our party's organization, and all problems could generally be dealt with on the basis of a friendly cooperative attitude. For instance, when the labor union was established, the attitude of the foreigners changed from one of suspicion and fear to one of support, and there was not only willingness to provide office space, also to install two air conditioners and two telephones, but also agreement forthcoming to have the labor union employ four special cadres and to allocate every month 2 percent of the actual amount of all wages for union operating expenses, so that the preparatory work for the establishment of the labor union could be smoothly carried out.

Second, it is necessary on the one hand to nurture a sense of devotion to the cooperative organization among its Chinese personnel, but on the other hand also necessary to have the Chinese workers maintain their class self-respect. Some of the Chinese personnel have the idea that the profits of the capitalists are derived from an exploitation of the workers, that working in a cooperative enterprise is working for the boss, some individuals even come to work singing "da gong zhai" [the worker], a popular Hong Kong ditty. Others even willfully waste or misappropriate enterprise material, considering it as "after all belonging to a capitalist, so that wasting a little or taking a little of it will not matter." Because of the incorrect guiding ideology, many enterprises continuously experience cases of our personnel acting nefariously by violating discipline and regulations, to the great dissatisfaction of the foreign parties. To cope with this situation, it is extremely necessary to strengthen education of our personnel regarding the true situation and regarding our policy. One big difference of the cooperative enterprises as compared with enterprises operated on the system of ownership by the whole people or by the collective is that both sides share in the profits. To be able to import foreign capital, we must of course allow the foreign party to earn legitimate profits. Operating in this manner, the foreign party will be able to earn profits and our side will have the use of foreign capital, learn advanced technologies and managerial methods and speed up the four modernizations. Through education many staff and workers came to understand that by being employed in a joint venture enterprise one still is a member of the Chinese working class, that as such one is also master of the country, and that one is also serving the four modernizations. This realization greatly raised their work enthusiasm.

At the same time as devotion to the cooperative enterprise is being nurtured, attention must be paid to strengthen education to counter corrupting influences; one must seize upon the symptoms of such and promptly take preventive measures. The Hong Kong personnel in a certain Chinese-foreign enterprise used to take some female employees out for merrymaking until late at night. When this became a problem, the party branch at the said enterprise promptly set these female employees right by education and thus helped them raise their consciousness. Paying attention to the creation of strict discipline and a healthy atmosphere in the Chinese-foreign joint enterprises will not only educate our staff and workers to resist corroding influences, but will also influence foreign personnel to change their bad habits and respect discipline and the law. There have been cases of Hong Kong personnel who after joining the cooperative venture gave up gambling and curbed their nighttime activities.

Third, in the same way as it is necessary to ensure the benefits for the foreign party in any cooperation, it is also necessary to protect the rights and interests of the state and the staff and workers. There are some employees in responsible positions on the Chinese side in Chinese-foreign cooperative organizations who owing to their insufficiently enlightened guiding ideologies treat the foreign personnel with the attitude of the state representatives of the joint state-private enterprises of the 1950's, placing the two parties in a position of two antagonistic opposites, which makes it impossible for the foreign party to continue the cooperation. It is therefore necessary to treat all foreign parties most carefully on the principle of equality and mutual benefit, guarantee them the beneficial treatment prescribed in the "Chinese-Foreign Joint Venture Contract Law," however, also to take care not to relinquish one's own principles and to use the joint venture form also as a guarantee for the rights and interests of the state and the staff and workers on the Chinese side. There was, for instance, an assistant manager of the Hong Kong party to a jointly managed enterprise who planned to raise the salary standards for managerial staff of the enterprise to more than 30 times above that of the ordinary staff and workers. The party branch was of the opinion that paying high salaries to managerial staff of the cooperative enterprises would be in order, but not the paying of excessively high salaries, because this would reduce enterprise income and be harmful to the mutual interests of both parties. Later, the assistant manager of the Chinese side took action and persuaded the other side not to do it. Finally, the other party said with deep feeling: It would indeed be a 100 percent failure to completely and mechanically copy the Hong Kong methods of distribution; success can only be achieved by integrating measures with the actual situation in China. An assistant store manager of the said enterprise (belonging to the personnel of the Hong Kong side) once saw one of the employees of our side tell a few jokes on the work floor. The assistant manager immediately grabbed away the said employee's identity card and furthermore threatened to have him discharged. When the party branch heard of it, he felt this was too harsh a treatment, besides, this assistant store manager after all had no authority to take action against staff and workers on the work floor. His action not only exceeded his sphere of authority, but also displayed a certain disrespect for the Chinese side. Finally, the assistant manager of the Chinese side raised serious objections. The chief manager regarded our objections as justified and criticized the way the assistant store manager had acted, also restored the employee in question to his position. When all this was over, the party branch also applied stern criticism and education to the said staff and made him realize his own mistake.

The facts prove that as long as we follow appropriate work tactics and apply correct methods, further improvements will be achieved in our foreign economic cooperation.

ECONOMIC DEVELOPMENT ZONES

REPORT EXAMINES NEW PORT CITY DEVELOPING IN JINAN

HK030654 Hong Kong ZHONGGUO XINWEN SHE in Chinese 0313 GMT 2 Jun 86

[Report by ZHONGGUO XINWEN SHE reporter Zhang Liang [1728 0081]: "New Port City on the Coast of the Huang Hai"]

[Text] Jinan, 2 Jun (ZHONGGUO XINWEN SHE)--A new port city is rising on the coast of Huang Hai. Its deep-water coal transport dock of the largest berthing tonnage in China was built during the Sixth 5-Year Plan and is now open to the world. This is the 35th port China has opened to the world.

The Former Jiumizhai Is the Port City Today

Shijiu is located on the coast of Huang Hai 10 km east of Rizhao, Shandong. Driving into Rizhao and turning into the Shijiu port district, we passed one modern building after another--the post and telecommunications buildings, a department store, customs, the commodities examination building, the seamen's club, and a hotel. The local masses say that Rizhao's development is benefitting from the building of Shijiu port. Today Rizhao and Shijiu have merged into one, shaping a port city with characteristics of the north.

According to some local fishermen, the reefs here along the coast are natural mortar-shaped pits dating from the northern Song Dynasty. The fishermen going north and south would dock their boats here and husk their rice in those pits. This is why it is called "Shijiuhai" [stockaded village for rice-husking] under the jurisdiction of Rizhao Town. An office was set up here in the Ming Dynasty to administer the affairs of a thousand households, and was called the "Shijiu office." It gradually became an important passage for merchants and travellers. A passenger and cargo dock of 500-tonnage was built here after the founding of the PRC, with an annual volume of loading and unloading of only 600,000 tons. Despite the fact that the place is marked on China's provincial map as the maritime gate on the southern coast of Shandong, and that Rizhao received the world-famous physicist, Dr Ting Shao-chung, who made a special trip there to pay tribute to his ancestors, it has not caught the attention of the world because of its inaccessibility.

In the course of China's modernization today, Shijiu port has been pushed to the forefront. The Chinese Government found this site ideal for a deep-water port in north China 6 years ago, and decided to build another large modernized dock for coal transport with huge investment following the second-phase of construction of the Qinhuangdao port coal transport dock. In less than 3 years, a coal transport dock of China's own design and construction has emerged in the former Kiumizhao.

Two Things of "The Superlative Degree in China"

Here we can find two things of "the superlative degree in China." The steel-stack bridge with a span of 1,144 meters soaring over the dark blue sea like a rainbow is the longest of its kind in China today. At one end of the bridge are two berths, each of 100,000 tonnage. It is the largest coal transport dock with the greatest berthing tonnage in China at present. Two imported gigantic coal loaders stand capable of filling up a boat with a tonnage of 100,000 within 18 hours. At present the annual loading capacity is 15 million tons of coal.

When the Yanzhou-Shijiu railway is connected, which will form a complete link with Shijiu port, the train will run from Yanzhou through Hezhe, Xinxiang, Jiaozhuo, and Houma, ending in Xian. This will form another east-west artery horizontal to the Lianyungang-Lanzhou railway. Shijiu has become another seaport for Shandong, Henan, Shanxi, and the great northwest.

Its Importance Will Be Felt in Another Decade

In recent years, Hu Yaobang, Zhao Ziyang, Li Peng, and Wan Li have on separate occasions made inspection tours of this port. The Shandong Provincial Government has set up the Shijiu Port Economic Development Zone here and is determined to absorb foreign investment, to import advanced technology, and to further the economic development of the hinterland. Officials of the Shijiu Port Construction Headquarters told us that another seven berths of 10,000-tonnage to be built during the Seventh 5-Year Plan are included in their plan. Two berths for imported timber will get under way within this year. Another berth for the loading and unloading of sundry goods will be completed and put into use in the near future. Not long ago, Wang Guang-ying, director of the board of Everbright Industrial Corporation, and Metallurgy Minister Qi Yuanjing personally arrived at Shijiu to make preparations for the building of a large iron and steel works. To work in coordination with the first-stage project of the works, which has a capacity of producing 3 million tons of steel, construction will begin on a berth for mineral ores of 150,000-tonnage during the Seventh 5-Year Plan. A thermal power station with a capacity above 1.2 million kw is under preparation for its first stage of construction.

Premier Zhao Ziyang is quite interested in the development of the tourist resources here. North of the port district lies a stretch of golden sand beach 20 km in length. Wanpingkou and Diaoyutai, the two lagoons, are rare natural summer resorts where the waters are clear and tranquil. Sishan, with its many hills and peaks rising one higher than another, as well as the miles of forest belt along the beach of Dashawa, are wonderful scenic spots for touring and recuperation.

The good climate and geographical advantages of Shijiu port will help it gradually develop into a comprehensive modern port with a volume of loading and unloading of millions of tons. The local inhabitants tell visitors with pride: "Shijiu's importance will be felt in another decade."

ECONOMIC PLANNING

WUHAN'S ECONOMIC PLANS FOR 1986 REVEALED

Wuhan CHANGJIANG RIBAO in Chinese 2 Jan 86 p 2

[Article by Feng Chuanyue [7458 1413 6390], director of the Wuhan City Economic Commission: "Adhere to Reform, Advance Energetically, Struggle To Complete the Seventh 5-Year Plan; Consolidate and Develop the Fruits of the Reform, Work Hard To Stimulate the Industrial Economy"]

[Text] In the past year the vast ranks of workers and cadres in Wuhan's industrial front have, during the course of the "opening of the three towns" and intense competition on the market which have involved great change in the objective conditions of industrial production, enthusiastically adhered to reform and made pioneering advances. It is estimated that the city's gross industrial output for 1985 will increase 13.6 percent over the year before; profits and tax revenue will increase 26 percent and financial revenue will increase 27 percent, thus achieving the goals of the "four increases and three equal steps." This demonstrates that Wuhan's industrial economy has begun to free itself of traditional views and rigid models and has entered onto the right track.

The year 1986 was the first of the Seventh 5-Year Plan of the national economy. Industries throughout the city have shouldered a tremendous burden and are faced with a rigorous challenge. The guiding ideology for the new year for Wuhan's industrial economy is: emphasize products and quality, build a foundation and increase actual strength. We must regard product development as an important strategic policy, stress improving product quality and reducing consumption and the "three reforms and one transformation." This means we must conduct the reform in-depth, accelerate the pace of technological reform, and enterprise reorganization and integration, and promote the modernization of enterprise management. We must concentrate our efforts, allow the masses to make decisions, truly get a handle on high-quality, new variety products that bring in good returns, consume few natural resources that can bring in much foreign exchange, and that meet advanced domestic and international standards. We must also improve our ability to compete, to effect inland development, to absorb (foreign technology, capital), and to promote the enhancement of the level of all industries as well as augment urban economic strength. To accomplish this we must:

1. Persevere in enlivening enterprises, especially the large- and medium-sized, central enterprises, deepen and complete internal enterprise reform, and energetically create a good external environment for enterprises. In the reform, we must adhere to both forms of civilization, conscientiously strengthen ideological and political work, ceaselessly improve the political quality of cadres and workers and arouse the enthusiasm of the vast ranks of the workers for socialism.

2. We must create good business strategies for enterprises, the core of which is improving products. This requires making good business-related policy decisions based on the needs of the development of the national economy and domestic and international market conditions, and setting strategic objectives regarding the quality level of enterprise products, actively adjusting the product mix, and making great efforts to improve quality, develop different varieties, and reducing consumption in manufacture. After a few years of work, the first step will be to enable the city's major products to catch up to the advanced national level for the same type of product. The second step will be to enable many products to reach international levels of the late 1970's and early 1980's, and to manufacture some products that will approach international levels of the time, so that the quality of the entire city's industry can be enhanced greatly.

3. We must improve enterprise business management. We must meet the needs involved in a planned commodity economy, and, revolving around the center of business management, understand concepts relating to the market, competition, and open door-type management in order to implement organic management over communications, scientific research, production and the market, and strive to reform internal enterprise management systems. We must implement output related systems of responsibility, as well as management, administration, and accounting on different levels, taking the greatest advantage of enterprise internal strong points and potential so that communications are rapid, decisions are accurate, leadership is effective, returns are high, and enterprise ability to adapt to change, to take on responsibilities, to compete and to make profits are enhanced.

4. The development of horizontal economic alliances. Proceeding from the creation of an open door, networking economy, the development of the role of central cities, and the formation of highly integrated economic strength, we must strive to develop diversified horizontal economic and technological relations among urban enterprises, factories, and units of scientific research, and between city and countryside, develop enterprise clusters composed primarily of dominant products and enterprises and integrate together readjustment, the forming of associations, consolidation, and technical innovation. We must unite to develop new products, techniques, industries, bases (for raw materials and product manufacture), and international and domestic markets.

We have to work together to improve our ability to absorb and make Chinese imported technologies and equipment to gradually create a socialized, specialized large-scale industrial structure in which "large and small enterprises work in close association, the city and countryside are developed in a coordinated fashion, and interlocking relationships are established between city and countryside and province and city" in order to promote the rationalization of enterprise organization structure, product mix, professional trade and industrial structure and to increase the economic returns of the entire society.

HEBEI'S ECONOMIC SITUATION FOR 1985 SUMMARIZED

Shijiazhuang HEBEI RIBAO in Chinese 4 Jan 86 p 2

[Article provided by the Hebei Province Bureau of Statistics: "A Summary of the Sitution in the National Economy of the Entire Province in 1985"]

[Text] With the stimulus of the overall economic reform, there was good, comprehensive economic development in Hebei in 1985. Gross social production output, GVIAO and Hebei's share of the national income all grew more than 10 percent over 1984, and major economic norms of the annual plan may all be met.

The Flourishing Development of the Agricultural Economy During the Course of the Readjustment of the Industrial Structure

In 1985, the second stage of the reform was begun throughout the rural areas of the province and a fairly large readjustment of the industrial structure was initiated. In the cultivation mix, cotton acreage was reduced 2.91 million mu while acreage for oil-bearing crops was increased 3.46 million mu. A stable increase in grain production was maintained, with total output reaching 36.5 billion jin, a record high increase of 1.1 billion jin over 1984. Total cotton output may reach 1.4 billion jin, a decrease of 600,000 million jin compared to 1984. Total output for oil-bearing crops attained the figure of 1.5 billion jin for a recordbreaking increase of 300 million jin. Total output for sugar beets, flue-cured tobacco, jute, bluish dogbane, and dried and salted fruit all showed differing degrees of growth. Annual GVAO may reach 20 billion yuan, a 7.2-percent increase over 1984.

Industrial Production Shifted From an Overly Rapid Rate of Development to One of Basic Normality

The growth rate for industrial production in 1985 was quite rapid, but economic returns did not increase accordingly. A gradual decrease in the growth rate for returns appeared beginning in July. The gross annual industrial growth rate was approximately 33 billion yuan, an increase of more than 13 percent over 1984.

The following characteristics were seen in 1985 for industrial production: 1) Light industry developed more rapidly than heavy industry. Output value for light industry increased approximately 15.9 percent compared to 1984, while heavy industry grew 11.7 percent; 2) production of energy and raw materials grew steadily; Production of pig iron, steel, finished steel products, raw coal, and electricity increased 5 to 10 percent over 1984; 3) production of goods needed to support agriculture showed a tendency to fall; 4) economic returns have been somewhat increased. Total output value for industrial enterprises within local budgets for the first 10 months of the year grew 10.5 percent compared to the same period the year before, while revenue from product sales increased 16 percent, for a 14.1-percent increase in profit and tax revenue. Profit handed over to the state according to fixed specifications increased 7.2 percent.

Scope of Investment in Capital Construction Controlled

By the end of August 1985, 273 local capital construction projects were eliminated throughout the province and investment was cut by 110 million yuan. In 1985, approximately 3 billion yuan of capital construction was completed by state-run units for an increase of 9.6 percent over 1984. About 1.6 billion yuan was invested in renewal and renovation measures, for an increase of 7.8 percent compared to 1984.

The state arranged for Hebei's six focal construction projects fairly rapidly, basically completing the requirements of the plan. Accumulated investment for the first 10 months of the year represented a 90.5 percent completion of the annual plan, which was greater than the degree of completion required in the assessment of the plan for the entire province regarding capital construction investment.

Lively Rural and Urban Markets; Further Expansion of Foreign Trade

Hebei's retail markets in 1985 were quite lively. With the exception of some durable consumer goods in short supply, there was an abundance of commodities. Total retail sales value for the year may reach 19 billion yuan, a 13-percent increase over 1984.

Foreign trade was further expanded. Total value of commodities exported in 1985 for the province increased approximately 67 percent over 1984. Projects involving foreign capital and technology continued to show flourishing growth. Total monetary value for contracted projects involving foreign capital increased 16-fold until September 1984 compared to the prior year.

Increased Financial Revenue and Decreased Expenditures; Amount of Currency in Circulation Stabilized

Financial work in 1985 focused on developments in the reform of commodity prices and wages. Despite factors causing increased expenditures, financial revenues showed a fairly large increase due to the expansion of production and circulation, increased revenues, reduced expenditures, and improved management work in tax collection. Local revenue for the first 10 months of the year in the province overfulfilled, 2 months ahead of time, the Central Committee's readjusted budget by 2.5 percent. It is estimated that local revenue for the year will increase more than 13 percent over 1984. The net amount of currency put into circulation may be about 15 percent less than in 1984.

The People's Living Standards Continue To Improve

In 1985 the state began a preliminary reform of the wage system and at the same time, loosened price restrictions on meat, eggs, fish and seafood, vegetables, and other nonstaple foods while providing adequate subsidies to urban residents, causing increases of varying degrees in income of urban and rural citizens. It is estimated that the average per capita income for living expenses of urban working families will reach 660 yuan, a 19-percent improvement over 1984, or more than 9 percent after deducting the factor of commodity price. Average per capita pure income for peasants may reach 390 yuan, a 13-percent increase over 1984, or an improvement of approximately 6 percent after deducting the factor of commodity price.

Total wages for staff and workers continues to grow, and have increased approximately 10.6 percent over 1984, while average per capita wages increased 8.1 percent.

It is estimated that, along with the increases in income and the continued improvement in the level of consumption of urban and rural residents, the average per capita growth for all throughout the year will be 15.7-percent higher than in 1984, and that the real increase, after deducting the factor of commodity price, will be 9.2 percent.

INDUSTRY

FIVE-YEAR RECAP OF INDUSTRIAL BOILER DEVELOPMENT

Shanghai DONGLI GONGCHENG [POWER ENGINEERING] in Chinese No 6, 15 Dec 85 pp 33-40

[Article by Shi Qiangsun [2547 1730 1327]: "The Development of Industrial Boilers in China 1981-1985"]

[Text] I. A Survey of Development

By the end of 1983 the number of industrial boilers nationwide had reached 280,000 with 470,000 steam tons, or, according to another source, there were 250,000 boilers with 530,000 steam tons. They should be more or less in this range. Over 200 million tons of raw coal are consumed annually.

The number of industrial boiler makers in China was readjusted from over 500 in 1981 to 214 in 1984 which were qualified to apply for production permits. After more than 2 years of double checking and spotchecking, production permits will be issued to those plants which meet conditions. In 1983, output of the industry as a whole was about 66,000 steam tons and over 30,000 boilers. Along with the growth of the national economy and improvement in the people's living standard, installed capacity of industrial boilers will continue to expand and it is expected to double by the end of this century. Currently, the main industrial boiler products are divided into eight subcategories: hand-fired boilers, chain-grate boilers, reciprocating boilers, spreader boilers, fluidized-bed boilers, pulverized coal fired boilers, gas-oil fired boilers, and hot water boilers. There is a total of 77 varieties, of which 17 are chain-grate boilers which have the most. Based on the quantity of evaporation, chain-grate boilers make up more than 60 percent of the total quantity of evaporation.

Before describing the development in recent years, it is necessary to review briefly the development of industrial boilers in China. Since current product development has its own historical background, a brief review will help us understand present circumstances.

Industrial boilers in China began to develop in the early 1950's. During the more than 10 years until the early 1960's, the main products were modeled on foreign ones which are divided into the header and bent-tube types; the American horizontal external fired return fire-tube type; and the Soviet model K and model DKB. These boilers can still be used. Their main feature is that they all use high-grade coal as the design coal, their tube boilers come in bulk, and those with a capacity under 4 tons per hour are hand-fired. Their heat efficiency is low and automatic control instruments are almost nonexistent. Beginning in the 1960's, as steel materials were in short supply and old designs did not meet current needs, China gradually designed on its own with the guiding ideology of economizing on steel products. Particularly prominent among low capacity products was the development of packaged water and fire tube boilers. This type of boiler is formed by attaching water-cooled walls to external fired horizontal return fire-tube boiler or the HRT model. It was extensively used in the early 1970's because it has a compact construction and is easy to manufacture. Chief among water-tube boilers are the double horizontal chain-grate boilers, but there is also the double vertical barrel model D layout and construction. In the later part of the 1960's, China entered the stage of complete self-designing, and typical boilers with a capacity between 1 and 4 tons per hour are packaged water and fire tube boilers, of which a few are the double vertical barrel type. Boilers with a capacity of 6 tons per hour or higher are the double horizontal barrel type. The design coal is primarily high-grade bituminous type and varieties including anthracite, lean coal, and brown coal are also derived.

After 1970 there was shortage of fuel coal supply, the quality of coal declined and departments using industrial boilers carried out boiler transformation one after another. After they were delivered to the consumers, factory made boilers suitable for using high-grade coal were refitted, resulting in considerable waste. In order to suit current circumstances, after 1976 the industrial boiler industry vigorously developed boilers for burning bony coal. By the end of 1979 a total of 56 standards had been developed, most of which were fluidized-bed boilers but also included the new types of reciprocating and chain-grate boilers. Great results were obtained in the development of gangue fluidized-bed boilers with a combustion calorific value below 2,700 kilocalories per kilogram. In 1980, along with the readjustment of industry, the quality of coal was improved and orders for boilers that burn bony coal became few. The ash extraction density of fluidized-bed boilers is high, the performance of ash extractors in the country is poor and pollution is severe. The fuel coal must be crushed and screened, and environmental and sanitation conditions are very poor. Consequently, many consumers have stopped using fluidized-bed boilers. However, they are still used in coal mines and areas with bony coal, and recently there is a trend toward an increase. Coal mines annually discharge large quantities of gangue, and fluidized-bed boilers are the only boilers that can burn gangue of such low caloric value. Consequently, fluidized-bed boilers still have a considerable market in this area. There remains a great deal of work to be done in complementary auxiliary equipment, particularly in the comprehensive utilization of ash extractors, crushers, and ash. The foregoing is a brief survey of the development of industrial boilers in China prior to 1980.

After 1980, industrial mining enterprises were readjusted and restructured, the quality of coal in coastal cities increased, but due to a nationwide energy shortage and inadequate supply of coal, locally produced low-grade coal also entered the market. As a result, the quality of coal used by industrial boilers remained not too stable, generally centering on bituminous coal of medium or higher grades. Before 1980 industrial boilers developed products for high-grade and bone coal but lacked products for medium-grade coal, so that after 1980 the industrial boiler industry decided to develop products for medium-grade coal (with a calorific value of 3,700-4,700 kilocalories per kilogram), and conduct joint design under the leadership of the Electrical Engineering Bureau of the Ministry of Machine-Building Industry. The types of boilers adopted can be summarized under the following four categories:

(1) Two types of hand-fired boilers have been developed for capacities of 0.2 ton per hour and 0.5 ton per hour. One is the open-flame return combustion boiler and the other is the double layer stoker.

(2) A new packaged inclined barrel boiler system has been developed for capacities of 1 and 2 tons per hour, such as shown in Figure 1.

(3) A new assembly water tube system has been developed for capacities of 2 and 4 tons per hour. This is the vertical double barrel chain-grate type of boiler, as shown in Figure 2.

(4) For capacities of 6, 10, and 20 tons per hour, the original horizontal double barrel chain-grate boilers are still used, as shown in Figure 3.

The boiler safety regulations issued by the Ministry of Labor and Personnel in 1980 provided that boilers with a capacity above 1 ton per hour must be mechanically fired. But due to the cost, materials, conditions of use and other objective reasons, those under 1 ton per hour at the present stage of hand-fired boilers still need to go through a period of transition. Two types of boilers, the open-flame return combustion boiler and double layer stoker have been developed based on the society's experience in boiler transformation. Judging from 2 years of actual operation they are still not too ideal and the basic shortcoming remains that they are hand-fired. Open-flame return combustion boilers have already been improved into a draw-plate lifting structure which can be operated and used continuously. Double layer stokers still have some problems in their structural design and method of operation while their efficiency is low.

The second and third types of boilers were developed to deal with the unsafe and easy burning of drum wrapping at the lower section of barrels of water and fire tube types of packaged boilers which are manufactured in relatively large quantities. The efficiency of the second type of packaged barrel boiler system still maintains an efficiency of 76 percent or higher after 1 year in operation. Their output not only assures specified parameters but they also have excess load surplus which are welcome by consumers. The third type of boilers with capacities of 2 and 4 tons per hour are water-tube assembly sets. They are safe and reliable during use, but the work volume of heavy boiler wall installation is large. With the exception of consumers in mountainous and inland areas where transportation is difficult, the general preference is the packaged construction or assembly boiler with a very high degree of assembly. Small capacity packaged water-tube boilers generally use a vertical double barrel layout. Vertical double barrels can be further divided into two types: one resembles model DKB in mid-barrel, the other has a model D arrangement on one side of the barrel. Judging from the development trend of industrial boilers at home and abroad, double-barrel boilers with convection beam arrangement on one vertical side and a stoker arrangement on the other side are extensively used. The structure can therefore be more compact, serialization is made easy, the barrel can be lengthened at any time with the increase in capacity, and the corresponding increase in the barrel's steam-water dividing section assures the quality of steam. The fourth type is the horizontal double barrel chain-grate boilers. This type of boiler was initially modeled on the model D of Czechoslovakia which had a capacity of 20 tons per hour. Later, China successively designed by itself the two capacities of 6 and 10 tons per hour with double layer layout and heavy boiler walls. The operation of this type of boiler satisfies consumers though metal consumption is high, boiler houses must be tall and investment is big. The present joint design has given consideration to the long period of time it takes to develop new structures for large capacity products. In order to stress developing products using medium-grade coal, matured types of boilers are still being used in order to accelerate progress.

For the appraised heat efficiency of jointly designed products that use medium-grade coal, with the exception of hand-fired boilers which is between 62 and 65 percent, all other products are 76 percent or higher. Results of retesting packaged inclined barrel boilers with capacities of 1 and 2 tons per hour after 1 year in operation show that they still maintain an efficiency of 76 percent or higher.

In the period between 1980 and 1984, many manufacturers developed quite a few of their own new products besides those that are jointly designed. In 1984 alone 29 varieties of new products were appraised. Judging from these new products the following features can be seen: 1) the variety of water-tube boilers with small capacities between 2 to 4 tons per hour has increased, among which are the packaged and assembly types. Moreover, water-tube single layer layout and construction with a capacity of 6 tons per hour has been developed. 2) The variety of reciprocating boilers has increased. Because of the ease of manufacturing, low dust content in smoke, suitability of fuel coal, capacity has been developed from 0.5 to per hour to 10 tons per hour. Two types of reciprocating stokers are currently being manufactured, the stepped and horizontal types. 3) The variety of hot water boilers has increased. 4) With the increase in the variety of medium-grade coal, their heat efficiency is generally higher than older products. 5) Most of the products are complemented with control boxes, basically implementing the Ministry of Machine-Building Industry's 1980 documents on provisions concerning complementary equipment.

With the exception of steam boilers, five standards of joint design have been made for hot water boilers. Specifically they are as follows:

(1) RSL 250 pressure 7 kgf/cm^2, temperature of water discharged 95°C
(2) DZL 360 pressure 13 kgf/cm^2, temperature of water discharged 130°C
(3) RZL 600 pressure 7 kgf/cm^2, temperature of water discharged 110°C
(4) DZL 600 pressure 10 kgf/cm^2, temperature of water discharged 130°C
(5) DHL 1200 pressure 13 kgf/cm^2, temperature of water discharged 130°C

Apart from the five types of products mentioned above, quite a few new products have been developed by various manufacturers in recent years. At present, there are various types of hot water boilers with capacities of 600,000, 1.2 million, 2.4 million, 3.6 million, 4 million, 6 million, 9 million, and 12 million kilocalories per hour.

In order to conserve energy, in the future we still need to vigorously develop hot water boilers and gradually replace steam with hot water concentration for the supply of heat. Therefore, other than perfecting existing small capacity hot water boilers, we should also develop those with 25 million to 50 million kilocalories per hour and even bigger coal-burning hot water boilers in order to initiate conditions for making overall plans to construct large integrated thermal network.

In view of the improvement of industrial boiler products in recent years in terms of variety, quality, and standards, the following aspects can be summarized:

1. Leaders of the ministry and bureau have stressed the work on standards and quality. Since 1980 they have strongly stressed the work on standards, convened a series of work conferences on industry standardization and have vigorously promoted the adoption of international standards. Currently there are over 30 state and ministerial standards in China's industrial boiler industry. The various standards on design, manufacturing, installation, thermal engineering tests, complete auxiliary machinery, operation, and maintenance are basically complete. The substance of these standards are basically similar to those in industrially developed countries. The work on issuing permits jointly carried out by the Ministry of Labor and Personnel and Ministry of Machine-Building Industry has played a significant role in the improvement of the quality of products of manufacturers.

2. Various departments in concern stress the work of scientific research and technical development of industrial boilers. The State Economic Commission, State Science and Technology Commission, State Supplies Bureau Ministry of Machine-Building Industry, colleges and universities, manufacturers, consumers, research institutes, as well as concerned departments in charge of energy conservation at the provincial and municipal levels all actively support S&T development of industrial boilers. At the 1982 annual meeting of the Society of Power Engineering, quite a few number of essays described the work in this area. Here we summarize scientific research and development in the last 2 to 3 years as follows:

(1) Research and testing of chain-grate stokers have primarily focused on the three areas of airtight sealing, air mixing, and stoker construction.

Airtight sealing and air mixing are the key to increasing stoker combustion efficiency. During 1983-1984, plants and institutes concerned launched tests and research on vertical air mixing and airtight sealing in small chain-grate stokers, developed new airtight sealing boards, carried out a large number of cold-state tests, and performed thermal engineering determination of comparative tests on heat efficiency before and after refitting. Boiler efficiency was raised by 2 to 3 percent. The achievements of these tests will be popularized once they are appraised. In recent years a type of large stoker has been developed and are being used in joint design. After more than a year of operation and testing, they have been able to meet the requirements of use. They are characterized by their higher intensity than the original small stokers, low metal consumption, and a low leakage of coal. The problem is that sometimes their air vents can easily become blocked up. To deal with this shortcoming, the Guizhou Boiler Works developed an improved construction which is currently being tested. Chain-grate stokers are the most extensively used stokers in China. Their performance has a significant impact on the results of energy conservation of industrial boilers. The efficiency of new jointly-designed products with capacities of 1 to 2 tons per hour is higher than that of the old products largely because of improvement in stoker construction. In view of the quality of chain-grate stokers which are currently mass produced in China, both vertical and lateral airtight sealing have a serious air leak problem which results in difficulty to regulate combustion. It can be seen from large numbers of thermal engineering test reports that the excess air coefficient is around 1.8 to 2. Outside China, this excess air coefficient of chain-grate boilers is controlled at around 1.5. This requires a long period of study, and in order to assure safe and reliable operation in thermal state without jamming dead and jamming while maintaining the lowest tolerance clearance, it is necessary that the four areas of design, technology, testing, and inspection are closely coordinated. We must continuously improve construction and gradually perfect it. Similarly, apart from the problem of airtight sealing, reciprocating stokers still have the problem of stokers burning out. At present, it appears that this problem needs to be tackled by the quality of materials. Manufacturers in concern have undertaken to study this problem which is expected to complete this year. In short, manufacturers, research institutes, colleges and universities have done a great deal of work on layered combustion stokers in recent years and have promoted the improvement of products. However, we can only say that this is just the beginning, initial results are barely in sight and a large deal of work remains to be done before they are truly reflected in specific products.

(2) In 1981, Chongqing University and Chongqing Boiler Works launched tests and research on the application of threaded pipes in coal-fired smoke tube industrial boilers. They studied Reynolds numbers between 6,000 to 30,000 hours, the flow and heat transmission character of air in a single-head threaded pipes, and performed industrial comparison tests on a KZL4-13-A II boiler. After 3,000 hours of continuous operation and observation, the inside wall did not show any noticeable wear and tear. Ash accumulation was not as serious as that in light pipes. Appraisal was made at the end of 1983 and it was affirmed that after using the threaded pipes in the secondary

return-stoke in the above-mentioned 4-ton per hour boiler, the heat absorption capacity increased by about 25 percent, which led to a drop in smoke temperature by 26° to 28°C, and because of the decrease in smoke loss, the original boiler efficiency was increased by 2.5 percent. It will take a long period of testing before comprehensive economic results are available.

(3) Definite progress has been made in the development of industrial boiler combustion automatic control in recent years. In Shanghai, industrial boiler combustion automatic control began at the Shanghai No 5 Chemical Fiber Plant and Minxing Chemical Plant. Subsequently, Shanghai No 5 Steel Works and others used DDZ II instruments. The DDZ II instrument is a more matured instrument which can completely take care of automatic control of industrial boiler combustion and feed water, though the price is relatively high with each set costing approximately 50,000 yuan. The cost of industrial boiler automatic control device based on international averages is around 10 to 15 percent of the total price of the boiler. The cost ratio of automatic control is somewhat higher for small capacity units such as boilers under the capacity of 10 tons per hour. At present, a boiler with a capacity of 4 tons per hour is sold for around 80,000 yuan and one with a capacity of 10 tons per hour for 180,000 yuan. Using the DDZ II instrument at 27 to 60 percent of the total cost is too expensive. It is worthwhile only if we install DDZ II instruments on boilers with a sale price of 50,000 yuan and a capacity of at least 35 tons per hour. In 1983, the Industrial Boiler Bureau and manufacturers in concern developed a special combustion automatic control instrument for small industrial boilers. In the course of operation it fully and automatically regulated the air-coal ratio so that under a 15 to 20 percent load fluctuation it automatically regulated the combustion quantity and steam pressure could basically be maintained within a variation of ±0.5 kgf/cm. This control system included oxygen fine adjustment automatic control, chamber negative pressure control, stoker ungraded governor mechanism, actuating mechanism of the air blower and intake device, stress pressure regulator, as well as boiler combustion automatic control instrument (the main control instrument).

In early 1984 this set of equipment was installed in the Shanghai No 5 Rubber Shoe Plant and remained satisfactory after half a year of operation. The main problem was the poor quality of the oxygen test instrument. Automatic control attachment systems used for small industrial boilers in Britain also utilize the same principle. After visiting our installation, the chief engineer of Robey Co., a large industrial boiler plant in Britain, indicated that the system they use is similar to ours. The principle of the system currently uses boiler steam pressure to drive the corrugated pipes of pressure ratio regulator. The extension or contraction of the corrugated pipes regulate the slide arm of slide-wire electrical resistance which changes the value of electrical resistance. This then changes the electrical resistance signals into voltage to output signal and control the size of opening of the air gate and stoker speed in order to obtain the optimum air-coal ratio. Outfitting a 4-ton per hour boiler with a complete set of automatic control costs around 15,000 yuan. For a 4-ton per hour boiler that costs 80,000 yuan this constitutes 18.8 percent of the total cost and is already quite high. Recently, Beijing Automatic Instrument and Meter Plant has developed microcomputer control, and the future of its popularization and development is largely determined by prices and costs. Industrial boiler combustion automatic control is an inevitable trend of development and the key is the quality and prices of instruments. We believe that development of this aspect in the future requires joint research among design and technical personnel of the instrument and meter industry, industrial boiler industry as well as the two ministries to develop special combustion automatic control devices and test instruments for small industrial boilers which are of low cost and reliable quality. In the near future, we must primarily improve and upgrade the performance and quality of oxygen measuring meters, coal measuring meters and pressure transducers. In the long run, it is hoped that we can develop a quick test instrument for carbon content in boiler slag. The realization of this instrument will be of enormous help to combustion automatic control devices.

(4) In recent years there have not been any new developments in water treatment of industrial boilers in the system, but there has been considerable growth in the extent of popularization. Prior to 1980, approximately 50 percent of the industrial boilers adopted water treatment. According to recent figures, in coastal areas industrial boilers that have water treatment make up about 70 percent. The number of production plants of water treatment equipment have greatly increased. In Wuxi alone there are more than 40 of them and it is estimated that there are at least 600 nationwide. This is favorable to popularizing water treatment of industrial boilers, but the capability of scientific research and technical development in water treatment remain weak and few new products have been developed. Although we have not seen too many water treatment equipment for small boilers abroad in recent years, three or four plants have separately imported equipment from manufacturers in the United States and New Zealand. They are characterized by a high degree of automation and they generally use electromechanical multi-unit valves. As many as four different types have already been imported by China. Based on the achievements of the tasks of Shanghai's colleges, universities, and institutes in concern, the Industrial Boiler Institute and Jiangyang Boiler Auxiliary Machinery Plant have jointly developed and manufactured program control multi-unit valves for boilers with a capacity of 4 tons per hour, modeling on those from abroad. In actual operation, the problem is the unstable quality of individual parts. We believe that the production and development of program control multi-unit valves is a key aspect of improving industrial boiler water treatment equipment. Even less work has been done in the problem of water feed and oxygen removal in industrial boilers. In this respect we should import some sample machinery and speed up progress in the task of oxygen removal.

(5) After 1980, industrial boiler makers have added ash extractors to all boiler products in accordance with the provisions of the Ministry of Machine-Building Industry. After a period of operation and testing, these ash extractors have played a role in curtailing pollution in operation and practice, but their efficiency is low at approximately 80 percent. In recent years quite a few units have successively developed a number of

new cyclonic ash extractors that have a higher efficiency. In order to achieve even more rational selection of auxiliary devices, the Ministry of Machine-Building Industry and the Ministry of Urban and Rural Construction and Environmental Protection jointly organized departments concerned to conduct in Shanghai, Wuhan, Tianjin, Beijing, and Nanjing comparative determination and appraisal of 26 ash extractors of different specifications according to a unified test method. Finally eight models, XZY, XZS, XZZ, SG, XZD, XDX, XS, and XND were set as the basis of auxiliary outfitting. Of these ash extractors, XZY and XZS are the exceptions that give a hand-fired boiler efficiency of 80 percent, the others are close to 90 percent. They can be regarded as China's second-generation cyclonic ash extractors. Cyclonic ash extractors are still the main type of ash extractors used by small coal-fired boilers in industrially advanced countries at present. According to the contact between our Shanghai Industrial Boiler Research Institute and the Lentjes Boiler Workers of West Germany and Robey Boiler Works of Britain, the efficiency of the cyclonic ash extractors they use are around 95 percent. Therefore, we still have a great deal of work to do in this area. The diameter of the Whirlwind of Britain is around ϕ 200 and that of West Germany is smaller. Their casing is of cast finish, and both their precision and wearability are good and they deserve to be used for reference.

(6) In recent years, the thermal engineering test capability of industrial boiler manufacturers has improved. As arranged by the State Economic Commission, industrial boiler test centers have been built in six boiler plants in Anshan, Beijing, Chongqing, Jinan, Xi'an, and Changsha which are responsible for providing assistance to thermal engineering tests of manufactured products in their own greater regions. At present, three centers have been checked and accepted and efforts are made to check and accept all of them this year. Currently many fuel corporations in large cities undertake tasks of testing, but individual labor departments also carry on the professional work in efficiency tests. Because the State Planning Commission and State Economic Commission stress industrial boiler heat efficiency tests, the extent of testing of industrial boiler products in China has greatly increased, which has played a significant role in upgrading and improving products. In the future we still need to strengthen the setup for fuel analysis and laboratory tests.

(7) In recent years, fuel supply departments have carried out measures of power mixing of coal in several large cities so that the fuel coal calorific value and volatile are relatively stabilized within a certain range, which is beneficial to energy conservation and efficiency of industrial boilers and raising efficiency. At present, the key to the problem of coal mixing is particle size. For layered combustion, uniformity of particle size is very important. Currently the quality of screens in coal distribution yards is very poor. Nominally it is specified that fuel coal particles must not exceed ϕ 50 mm in size, but actually many are large lumps greater than ϕ 50 mm. The results will be even more tangible if fuel supply departments can strictly control particle size.

II. Existing Problems

Since 1980, definite results have been achieved in product development in China's industrial boiler industry, but there is still a gap between the demands of state energy conservation and advanced standards in the world. Many problems relating to present variety and quality remain exposed.

Last year when the two ministries conducted spot checking and double checking for the issuance of production permits, they found that the quality of products had declined among many manufacturers which had been checked and were thought to be qualified in 1983 while that of small manufacturers which initially did not qualify had all improved. Even some individual long-time manufacturers in the industry have serious problems of quality. This clearly shows that quality control work among China's industrial boiler makers is not stable and solid. With the supply of industrial boilers lower than the demand, it is not easy to do a good job in product quality conscientiously and in earnest. Take the manufacturing of chain-grate stokers as an example, China has a history of more than 30 years in the making of chain-grate stokers but so far not a single industrial boiler maker can manufacture chain-grate stokers that have a high level of performance and quality. The causes are numerous. Objectively speaking, a main reason is that "somebody will buy what is produced" and the manufacturers can be "satisfied" with the present standards of products because they mainly have output value and profits in mind. Tests, upgrading, and improvement most of the time bring no advantage to the manufacturers, and only when there are serious quality problems will they be compelled to do some tests. As a result, besides intensifying industry quality inspection, we must also intensify technical exchange in the industrial boiler industry at home and abroad, strengthen quality control, intensify instruction on quality, improve ideological understanding, commend and publicize manufacturers which truly perform well in technical development and quality control, summarize experiences and popularize them, and speed up the four modernization program to realize socialism in the motherland.

SMALL-SCALE ENTERPRISES

INDIVIDUAL ECONOMY DEVELOPS IN CHAOZHOU-SHANTOU

HK261214 Hong Kong ZHONGGUO XINWEN SHE in Chinese 1402 GMT 25 May 86

[Report: "Advantages and Disadvantages of Rapid Development of the Individual Economy in Guangdong's Chaozhou-Shantou Area"]

[Text] Guangzhou, 25 May (ZHONGGUO XINWEN SHE)--According to a report by reporter in Kunming [2651 2492 2494], in the 1st quarter of this year, the volume of retail sales of commodities by self-employed businessmen in the Chaozhou-Shantou area reached 143.9 million yuan, accounting for 18.9 percent of the total sales volume of social commodities of that area. This percentage ranks first on the mainland of China.

There are now more than 143,000 self-employed businessmen in the Chaozhou-Shantou area. Of the 14 prefectures and cities in Guangdong, this number is second only to that of the Guangzhou area. These self-employed businessmen run food shops, small hotels, and transportation, sell general merchandise, and so on. The rapid development of the individual economy has added vitality to the economy of the Chaozhou-Shantou area.

Jieyang County has favorable natural conditions for developing fruit production. However, in the past, the peasants were not willing to engage in growing fruit because transportation was very poor and it was impossible to transport in a timely manner the fruit grown there to other localities. In the past few years, the county government has encouraged and helped individuals to run transportation. This has resolved the problem of marketing produce of the county in other places and has stimulated the peasants' enthusiasm for growing fruit. In 1985, the output of fruit, such as bananas, tangerines, and so on exceeded 1 million dan, more than 60 percent over that of 1984.

The development of the individual economy in the Chaozhou-Shantou area not only has promoted the development of the social economy, but has also provided an outlet for part of the excessive and unused manpower. As a result, employment has increased in this area, which has too many people and insufficient arable land. The unstable factors of the society have also been reduced, which can be seen from the gradual decrease of criminal cases year after year. According to the statistics of the public security departments, the total number of criminal cases in the Chaozhou-Shantou area from 1983 to April this year is 40 percent less than that from 1981 to the first half of 1983.

However, the rapid development of the individual economy has also given rise to some social problems.

First, it has increased the pressure on traffic. With the rapid development of transportation run by self-employed businessmen, the number of vehicles has increased abruptly, making the highways crowded, and increasing road accidents. Besides, since there are more individual retailers than the town markets can accommodate, many of these retailers have set up booths and stalls on pavements and even out on the streets, thus blocking traffic.

Second, some evil phenomena of society have revived. For some time in the past, the shops run by a few self-employed businessmen in the Chaozhou-Shantou area, some small shops along the Chaozhou-Shantou highway in particular, became places for sheltering evil people and countenancing evil practices. Some lawless people gathered to gamble there, and others used these shops for hiding or forwarding contraband. From the winter of last year to February this year, the public security departments found 603 of these roadside shops that were engaged in illegal activities.

Judging from the overall situation, the rapid development of the individual economy in the Chaozhou-Shantou area has more advantages than disadvantages. So long as management is strengthened, the disadvantages can be eliminated.

PABST TO SET UP $25 MILLION BREWERY IN GUANGZHOU

HK090402 Hong Kong HONG KONG STANDARD (BUSINESS STANDARD) in English 9 Jun 86 p 1

[Article by Martin Howell]

[Text] Bosses of the American Pabst beer company perform a ground-breaking ceremony on the site for a huge new China brewery later this week.

The fifth biggest U.S. ale producer signed a deal to set up the plant several months ago, it was revealed this weekend.

Pabst has gone into partnership with the Zhao Qing brewery in Guangzhou for the U.S.$25 million project.

An existing plant that has been mothballed in Vancouver, Canada, is being shipped lock, stock and barrel to be rebuilt in China.

By the middle of 1987 Patst hopes it will be producing 750,000 barrels a year which chairman Lutz Issleib says will make it the largest brewery in the country. He also expects the company's first move out of the U.S. to be profitable in the short-term.

Mr Issleib told reporters in Hong Kong on Saturday that in the early stages 60 percent of the beer will be sold in China with 40 percent exported to the rest of Southeast Asia including here.

But he hoped this would become a 50-50 ratio to further ease any foreign exchange problems.

"We will be the first and only American brewery to set up in China after two years of negotiations," he said.

Pabst which has 12 main labels including Blue Ribbon has signed a 15-year agreement with the authorities.

The company has also already started talks for another brewery and is confident of making the move into China a huge success.

Mr Peter Wong, president of Pabst's distribution partner the Pacific Atlantic Trading Co, reckons the beer will "go like hot cakes."

"We already have the orders in hand if we can produce. Beer sales in China are soaring and there are hour-long queues for it," he claimed.

Pabst expects to get most of the ingredients for the ale from within China except for hops and beer cans which will have to be imported.

The venture will also mean the sale of the Chinese ginseng label beer in the U.S. as part of a two-way deal.

An 18-strong Pabst team is leaving Hong Kong for Zhao Qing on Tuesday morning including the firm's 80-year-old owner Mr Paul Kalmanovitz.

"He is very exicted by the prospects which is why he took an exhausting trip like this," added Mr Issleib who said the owner was too tired to meet the press.

Experienced technical staff and a Milwaukee brewery manager Bob Tiemann will help the Chinese in the plan.

The move onto Hong Kong's doorstep will make the local market even more competitive. The world's biggest brewer Anheuser-Busch still hopes to take over the San Miguel brewery in Hong Kong while European and Japanese firms are also seeking deals for both markets.

Pabst management says it has ousted Carlsberg as Hong Kong's second largest beer company after San Mig. But the claim of an 18 percent market share is being treated highly sceptical within the industry.

San Mig is acknowledged to have around 70 percent, Carlsberg between 10-15 percent and Tsingtao 5-8 percent. So it is difficult to see how Blue Ribbon could grab 18 percent as it fights for a fraction of the market place populated by other imported beers.

SMALLER U.S. ENTERPRISES SEEKING TRADE DEVELOPMENT

HK130351 Hong Kong ZHONGGUO XINWEN SHE in Chinese 0245 GMT 12 Jun 86

[News Roundup by correspondent Zhao Wei [6392 0251]: "American Medium-sized and Small Enterprises Seek Development Opportunities in China"]

[Text] Beijing, 12 Jun (ZHONGGUO XINWEN SHE)--Trade between the United States and China has in the past been almost all accounted for by big enterprises. Now U.S. medium-sized and small enterprises are also itching for a market share. A number of American manufacturers of Asian descent recently held a high-technology exhibition in Beijing in an attempt to make a start in creating a market.

According to Mr Lin Jiebing [2651 0267 1456], chairman of the Association of American Manufacturers of Asian Descent, who was one of the organizers of this exhibition, the annual sales volume of these manufacturers from the West Coast Silicon Valley generally runs from several millions to several tens of millions of U.S. dollars. They are not well provided with capital but they are highly competitive technologically. They are also quick to react to market conditions. Given the blood ties many of these traders have with the Chinese, they are confident of breaking into China's market. He said: "It is difficult to get anything started. But it is necessary to take the first step." The U.S. secretary of commerce and the governor of California expressed support for their brave action.

The Chinese responded with enthusiasm. Wu Mingyu, vice minister of the State Scientific and Technological Commission, praised them, saying that the products of these medium-sized and small factories are of a relatively high technical level and are very attractive in regard to quality, performance, and price. This exhibition is perhaps one of the smallest among foreign exhibitions in Beijing. But Mr Wu said: "A mountain is not necessarily high and its fame lies in its having an immortal as its resident." Every day, 500 or 600 people visited the exhibition. Most of them were responsible technical personnel of industrial departments and engineers of enterprises.

"Trading is unexpectedly successful," Wu Junjie [0702 0193 0267], vice president of the Time & Frequency Technology company (TFT), said. Orders under contract for the microwave transmitter-receivers and transceiver [diantai 7193 0669] monitors produced by this company were accepted. Chen Yizhi

[7115 0001 0037], a young executive of the Aot Company, was kept busy for days. Apart from giving lectures on technology, he was approached almost daily by people talking business or signing contracts with him. He considers that the semi-conductor and electro-optic cell measuring and stessing instruments were well received, partly because these instruments are first class U.S. technology and partly because the Chinese are badly in need of advanced testing and measuring means to raise the quality of electronic products. He thinks that the best future lies in using this company's advanced technology to produce these measuring and testing instruments in cooperation with China. Apart from being used at home, these products can be sold on the international market.

Of course, not all the manufacturers participating in the exhibition are so lucky. But those managers who had not done any business did not feel disappointed. They said: What is important is an opportunity to understand each other. In the past, there were too few opportunities for either the U.S. medium-sized and small enterprises to understand China's market or for the Chinese to understand U.S. medium-sized and small enterprises. Li Xinpei [2621 1800 1014], vice chairman of the Association of American Manufacturers of Asian Descent, said: U.S. medium-sized and small factories' technically advanced and highly adadptable but reasonably priced products are suited for China which is short of foreign exchange but badly in need of imported technology. But China must study ways of entering into cooperation with U.S. medium-sized and small enterprises, because these enterprises with limited capital cannot afford any long-lasting talks or any delay caused by the existence of numerous complicated procedures for examination and approval. He holds the view that if China's enterprises have the decisionmaking power to trade directly with medium-sized and small U.S. enterprises, then the latter will have more chance of success.

FOREIGN TRADE AND INVESTMENT

OPEN DOOR ACHIEVEMENTS IN POSTS, TELECOMMUNICATIONS

Beijing GUOJI SHANGBAO in Chinese 9 Sep 85 p 1

[Article by own correspondent Wang Chang [3769 1603]: "With Daily Improvement of Infrastructure and Continuous Adoption of Advanced Equipment, China's International Postal and Telecommunications Services Are Developing Rapidly"]

[Text] Since opening up to the outside world, China has made great progress improving its international postal and telecommunications services; infrastructure has been perfected constantly, and the volume of business has been increasing continuously.

With regard to international postal service, China has established direct postal service with 113 countries, and separate pieces of mail can be indirectly forwarded to every country or region of the world. Because certain units need to mail important documents, data or valuable goods, China has established insured letter and parcel post service with almost 100 countries and territories.

In order to shrink the time between airline flights and the amount of time it takes to process mail, and speed up mail delivery, China in 1980 instituted an international express mail service, which was highly welcomed by its patrons. The service is now in operation with 30 countries and territories, such as Japan, the United States, Canada, Great Britain, France, the FRG, the Netherlands, Australia, Singapore and Hong Kong. Incoming and outgoing mail amounts to 160,000 pieces annually.

Electronic mail is an advanced form of communication, available now in only 20-odd countries of the world. In China, preparations for the use of electronic mail are basically complete, and this service will begin in October this year,.

With regard to international telecommunications, China's infrastructure has been greatly improved. China now has four satellite earth stations. Shanghai operates a Pacific Ocean earth station, Beijing operates a Pacific earth station and two earth stations for the Indian Ocean. The submarine cable that existed in the past between China and Japan will be restored by 1986. Guangzhou and Hong Kong are connected by a land cable as well as by a microwave system. The international export bureaus of Beijing and Shanghai have installed programmable telex exchanges with 2,000 and 1,000 lines, respectively. Programmable international telephone exchanges and automatic telegram relay equipment will be installed and available for use within this year. By installing the above-mentioned equipment China has established direct communication circuits with 46 countries and territories.

At present China has instituted such international telecommunication services as telephone, telex, public telegraph, phototelegram, public express facsimile phototelegram, subscriber phototelegram, and data search services. Among these services, telephone services have increased at an annual rate of 52 percent in recent years, and it is estimated that the annual increases during the coming years will be at the rate of 3 percent. China now has direct telephone links with 30 countries and territories, through 761 circuits. With certain countries and territories with large volumes of operations these services are semiautomatic, using the CCITT No 5 signal system. In recent years the volume of international telex service increased at the rate of 40 percent, with the number of users having increased to 2,100 and the international circuits having been increased to 600. All international telex services throughout the country have automatic exchanges.

Since 1982 China has instituted public phototelegraphic and facsimile telegraphic services with Japan, Singapore and Hong Kong, a service that has increased by leaps and bounds. Not only will new connections be established for this service in Asia during this year and next year, but it will be also extended to Europe and North American.

Furthermore, China has employed far-end concentrator instruments in 1983 to link up, through the Italian data exchange network, for information retrieval services, and is now connected with the American TYMNE and TELENET data networks. Similar connections are expected to be established within a year or two with certain other countries.

COOPERATION MEETING WITH GDR HELD IN BERLIN

OW290405 Beijing XINHUA Domestic Service in Chinese 0755 GMT 27 May 86

[Article by correspondent Zhou Houji]

[Text] Berlin, 26 May (XINHUA)--The China-Democratic Germany Commission for Economic, Trade, Scientific, and Technological Cooperation held its second meeting here today. The commission, established in April 1985 by a governmental decision of the two countries, held its first plenary meeting in Beijing. In their speeches at today's meeting, Qin Zhongda, chairman of the Chinese Government delegation and of the Chinese side of the commission and minister of chemical industry, and Guenther Wyschofsky, chairman of the Democratic German Government delegation and of the German side of the commission and minister of chemical industry, expressed satisfaction with the work and achievements of the commission in the past year or so since its establishment. Both sides pointed out that the 1986-1990 agreement for exchange of commodities and payments signed by the two countries in 1985 had laid a good foundation for a long-term, stable development of economic and trade relations between them. The two sides also held that there is still a tremendous potential for economic, trade, scientific, and technological cooperation between the two countries.

It is reported that the volume of trade between the two countries in 1985 increased 60 percent over that of 1984. Their volume of trade will go up by 33 percent this year over last. The volume of trade indicated in the contracts the two sides have signed so far accounts for 76 percent of the total projected for this year. There is also smooth cooperation between the two countries in science and technology, geological prospecting, and providing labor service.

Ma Xusheng, Chinese ambassador to Democratic Germany, attended the meeting. The Chinese Government delegation headed by Qin Zhongda arrived here on 25 May for the meeting.

CLOTHING EXPORTS CONTINUE TO INCREASE

OW091016 Beijing XINHUA in English 0939 GMT 9 Jun 86

[Text] Beijing, Jun 9 (XINHUA)--China's clothing exports continue to grow. But quality must be improved to increase them more, INTERNATIONAL BUSINESS said today.

The government semiweekly reported that clothing exports for the first five months of this year had a value of 550 million U.S. dollars. Exports for all of 1985 had a value of 1.02 billion dollars.

Clothing is second only to crude oil as China's top export, according to the paper, and sales overseas have grown substantially over the past decade.

The paper quoted Zhong Quansheng, deputy manager of the Chinese Textile Import and Export Corporation, as saying the country exported 4.36 billion U.S. dollars in clothing between 1981 and 1985, 129 percent more than in the previous five years.

China began making clothing for export in the 1950s, but sales were slow, the paper said. Aside from politically-motivated import barriers, Chinese clothing did not follow international fashion, and so was imported primarily for sales by street vendors and discount stores.

Since then, working with foreign companies, the country's foreign trade departments have retooled their clothing factories and have improved their products' quality and updated their design, the paper said.

As a result, more than 1,000 clothing factories in China have customers in a total of 130 countries and regions, and one-third of them make clothes for higher-priced stores.

Still, Zhong said, China's clothing exports account for only three percent of the world's 50 billion U.S. dollar market.

According to the paper, "China wants to export more quality clothes and to increase their variety, and to do this the country is prepared to have more flexible trade arrangements with foreign firms."

FUJIAN IMPORTS OPTICAL FIBER EQUIPMENT FROM ITALY

OW080259 Fuzhou FUJIAN RIBAO in Chinese 26 May 86 p 1

[Article by FUJIAN RIBAO reporter Chen Huibo]

[Text] A contract was signed at the restaurant of Fuzhou's foreign trade center on 25 May between the Fujian Administration of Posts and Telecommunications and Italy's (Taletera-Pirelli) company on the import of equipment needed for the completion of the first-stage Xiamen-Nanping optical fiber telecommunications project.

The first-stage Xiamen-Nanping optical fiber telecommunication project (Nanping--Yongan sector) calls for the import of 1,920 circuits x 2 optical fiber cable and the equipment for the relative photo cell converter system. The provincial administration of posts and telecommunications finally decided to import the equipment from the (Taletera-Pirelli) company under Italy's Fiat Group.

Attending the contract-signing ceremony were You Dexin, vice governor of Fujian; and Lin Jinquan, head of the provincial administration of posts and telecommunications; as well as Italian Ambassador to China Marras, and (Kasoli), manager of the International Department of Italy's Fiat Group.

Before the ceremony began, Xiangnan, You Dexin, and He Minxue met with Ambassador Marras and Mr (Kasoli). (Kasoli) and the other Italian guests also discussed issues of cooperation with the comrades from the provincial economic commission and the provincial commission for foreign economic relations and trade.

The set of optical fiber telecommunications equipment from Italy is expected to arrive after September 1986. It will be installed, andput into operation in August 1987.

GUANGXI INCREASES 1985 EXPORT VOLUME

Hong Kong CHING-CHI TAO-PAO [ECONOMIC REPORTER] in Chinese No 47, 25 Nov 85 p 18

[Article by Ye Chuyang [0673 0443 7122]: "Guangxi Develops Foreign Trade"]

[Text] Favorable Tendency in This Year's Imports and Exports

This year, Guangxi's imports and exports show a distinctly favorable tendency as compared with last year. By 10 November the commodity export plan for the whole year had been overfulfilled. The value of all exports amounted to U.S.$301.85 million, which is 101.6 percent of the annual plan and an increase of 15 percent over the figure for the corresponding period last year.

Guangxi exports more than 2,500 kinds foreign trade, consisting of almost 5,000 items. Items that registered comparatively larger increases this year were granulated sugar, aniseed, the Western-type medicine levamisol, cassia bark, and fabric blends; export volume also increased considerably in fresh fruit and vegetables, live animals, rosin and tin. Among traditional staple exports that proved hot-selling items there were eight that were worth more than $10 million, namely high-quality rice, live pigs, canned goods, tea, rosin, bambooware, tin, and barite. Five items were of a value between $5 and 10 million. This year, several export items were also newly introduced into the international markets; they showed good competitive potential and sold well. Such items were the famous "Nixing" handcrafted ceramics; the "phoenix pots," a new product of which the United States placed an order for 400,000 pieces at once. This year the export commodities mix has also undergone a change, in that the proportion of industrial and mining products rose to 67 percent, and the proportion of agricultural and sideline products, native and special products has declined from the former 50 to 60 percent to the present 33 percent.

By now Guangxi has established trade relations with 73 countries and territories, and in recent years its trade with the United States, Japan, the EEC and the Third World has been expanded. Exports to Hong Kong and Macao during the period from January to October this year exceeded $120 million.

Effective Measures Used in Developing Foreign Trade

In order to develop its foreign trade, Guangxi has exerted efforts in various direction.

Guangxi has strengthened its leadership, improved its organizational system, adjusted the leading groups, trained key personnel, and steadfastly kept up its reforms. Whereas there were only specialized corporations dealing in grain and oil, local specialty products, animal by-products, industrial products, metals and mining products, textiles, chemicals, and imports, since last year, Guangxi has established specialized import-export corporations for products relating to light industry, arts and crafts, medicine and health care, base construction, machinery, nonferrous metals, and packaging. Furthermore, these corporations were given greater autonomy in concluding their own deals. At the same time, Guangxi selected, in line with the standards of the four modernizations, young progressive cadres for key leadership positions, carried out readjustments of the leading groups on a large scale, set up training classes in foreign trade schools to raise the quality of its cadres. The province also stressed the role of the Guangxi Foreign Trade Promotion Commission as a key link in the development of the province's foriegn trade activities.

Guangxi augmented its overseas foreign trade organizations and perfected its information network. For example it improved the organization of the Guijiang Enterprises Corporation in Hong Kong, set up a trade center in New York, and stationed a trade promotion team in France.

Guangxi allowed basic level and commodity supply units the benefit of retaining a large portion of foreign exchange, guaranteeing cash redemption, thereby inspiring enthusiasm among the departments concerned.

While firmly maintaining the principle of a united stand toward the outside world, Guangxi made equal efforts in developing exports within as well as outside of the plan; by the end of October agency exports had reached $50 million.

Guangxi strengthened control of export commodities. It carried out a system of controlling staple exports but allowing freedom in sundry exports to follow market conditions. It reformed the traditional method of procurements by changing single-line circulation, centralizing procurements through multichannel circulation, and procuring directly and from disparate sources. This reform increased the vitality of foreign trade enterprises and attained excellent results, so that province-wide procurement of commodities for export rose 29 percent compared with that of the same period last year. In these export procurements, there was a 65 percent increase in medicines, a 62 percent increase in light industrial goods and a 47 percent increase in goods in the category of native produce and animal by-products.

Guangxi employed such methods as "using imports to produce exports," "three imports and one compensation" [three forms of import processing and compensation trade] as well as integrating imports with exports, linked procurements, barter, joint operations by enterprises in the same line of business, importing technologies and improved varieties, supporting production, having products upgraded and updated, increasing export commodities that have a good market and increasing the supply of export goods.

Guangxi developed its advantage in natural resources and aggressively ran export commodity bases. For the last 2 years, with the support of the Ministry of Foreign Economic Relations and Trade, Guangxi allocated large sums for the construction of export production bases. Twenty-one export bases for the production of single commodities were set up for high-quality rice, pigs, chickens, beef cattle, black tea, cassia bark, fennel oil, and oranges, while a comprehensive production base was set up in Yulin Prefecture. Last year the bases provided commodities amounting to a total value of more than 190 million yuan, which represented 31 percent of the total value of export procurements. Export procurements from the Yulin comprehensive base amounted to more than 170 million yuan, which overfulfilled the plan by 12 percent.

Guangxi has adopted flexible methods of carrying out business such as to invite visitors in and to seek opportunities abroad. This year, Guangxi exhibited commodities at exhibitions in France, Italy, and Greece and other countries. In March, Guangxi held an export commodities exhibition and trade in Macao, promoting sales worth more than $20 million. At the end of November, a large-scale and comprehensive exhibition of Guangxi export commodities was held in Hong Kong, where negotiations on imports were also held. The province also held various small trade fairs, negotiations, and activiely participated in the Guangzhou Trade Fair. At the Guangzhou Autumn Trade Fair, just concluded, Guangxi transacted business worth more than $50 million. This year foreign parties have exhibited their commodities in Guangxi on six occasions. Recently the Japanese city of Kumamoto held a large-scale exhibit in Nanning. Over 70,000 people visited the fair and concluding transactions valued at over $400,000. Widespread contacts have broadened vision, brought exchange of information, established friendly relations, and opened up new markets.

Following the shift from a closed to an open economy, Guangxi's import trade has also seen substantial development, and the scope of imports is expanding almost daily. Industrial and agricultural production and the import commodity mix underwent some basic changes. In the last year of the Fifth 5-Year Plan, over $12 million in foreign exchange was spent on imports; last year this figure was somewhat over $87 million. This year orders for import goods reached the sum of more than $170 million, with $110 million having been delivered already. These figures represent an increase of 11 percent and 4.5 times, respectively, compared with last year's. The import commodity mix has changed from one in which steel products and chemical fertilizers predominated to one in which machinery, instruments, technology, and critical raw and auxiliary materials predominate.

Although there has been steady development in Guangxi's import and export trade, the scope of Guangxi's exports does not yet match the exceptional geographical advantages and abundant natural resources of the province. Last year, the total value of procurements for foreign trade accounted for only somewhat over 3 percent of Guangxi's gross value of industrial and agricultural output, and for approximately 1.3 percent of the total foreign trade procurements of the whole country, placing it into 17th position. The total value of exports accounted for 1.3 percent of the total value of China's exports, placing Guangxi into 15th position, while, furthermore, a considerable portion of its exports were primary products and roughly processed products. This explains the great disparity with the national levels, but also indicates that there is large potential and very favorable conditions for an expansion of Guangxi's exports.

GOVERNMENT SAID KEEN TO SELL HAINAN GAS TO HONG KONG

HK030350 Hong Kong SOUTH CHINA MORNING POST (BUSINESS POST) in English 3 Jun 86 p 1

[Report by Olivia Sin]

[Text] Hong Kong and China Gas Co Towngas) will start preliminary negotiations with China later this month over the purchase of natural gas from an offshore gas field south of Hainan Island.

A team of Chinese officials from the state-owned China Offshore Natural Gas Utilization Co. in Guangzhou will arrive soon in Hong Kong for the talks.

Towngas managing director, Mr Malcolm Matthews, said the talks will center on the long-term sales contract which has been proposed by China.

The talks will include such issues as the price of the gas, the reliability of supply, the specification of the gas and back-up supplies in case of emergency.

Mr Matthews said Towngas is interested in the offer, but has not yet decided to switch from its naphtha-based towngas to natural gas.

He stressed the company will not accept the offer unless it promises economic advantages to its customers.

Towngas has completed most of the financial and technical studies relating to the purchase of natural gas.

"But we have to find out more about the quantity of gas we need (in a couple of decades) and its pricing," he said.

The US$500 million gasfield off Hainan is developed jointly by the China National Offshore Oil Corp. (CNOOC) and the U.S.-based Atlantic Richfield Co.

A subsidiary of CNOOC, the China National Natural Gas Utilization Co, has signed a contract to buy the bulk of the gas produced from the field for 20 years.

China is therefore keen to sign similar long-term sales contracts with both of its domestic clients and Towngas.

Towngas carried out research to gauge its customers' opinion on the use of natural gas at the end of last year.

Mr Matthews did not give details of the results.

He said a proposal will be submitted to the Towngas board of directors over the purchase of natural gas when all the necessary data is available.

Some local catering business which use towngas have voiced concern over the cost of converting their cooking facilities and the possible loss in business hours.

Mr Matthews said such businesses will not have to shoulder the conversion cost. The conversion work will be done by Towngas.

Meanwhile, intensive preparation work is being undertaken by China to prepare for the development of the gas field and the downstream activities.

China will soon complete the drilling of two appraisal wells to evaluate the gas field's reserves.

The field estimated to hold 90 billion cu m of gas is said to be one of the biggest offshore fields in the world.

It will come on steam by 1989 and its annual production capacity will reach a peak of 3.15 billion cu m a year about three years later.

China plans to build a 1,000 km gas pipeline from Hainan to Shenzhen in a bid to solve the chronic energy shortage in Guangdong Province.

The California-based Fluor Engineering Group has been awarded the contract to act as the project services contractor for the pipe-laying work.

Mr Edward Hsia, the president of Fluor China Inc, a subsidiary of the group, said the company is already discussing with the Chinese the route of the pipeline, its technical specification, the financial requirements and the procurement of necessary supplies.

The contract was awarded in March and the plans are expected to be completed by the end of July.

Fluor is specialised in engineering, construction and the production of mineral resources.

HONG KONG PAPER REPORTS PROPOSAL TO BOOST ECONOMIC EXPANSION

HK080412 Hong Kong SOUTH CHINA SUNDAY MORNING POST (SUNDAY MONEY supplement) in English 8 Jun 86 p 1

[Article by Carolyn Leung]

[Text] Three young entrepreneurs have had a good hearing in Beijing for their scheme to raise U.S.$200 million for China's economic expansion.

The plan appears to be very simple--for every $1 China invests in the fund-raising scheme, the trio will put in $5 to expand the capital pool into $6.

When China forms a joint venture with a foreign partner in investment projects, the capital pool will be expanded to $12 as the foreign partner has to put in $6 as well.

The $12 dollar capital can then be expanded into $48 according to the gearing ratio of 3 to 1. The gearing ratio is a balance between a company's debt and equity.

When the U.S.$200 million is raised the money will be used to finance China-related projects.

The men behind this somewhat unusual idea are David Tang, managing director of Cluff Investments and Trading Ltd; Arthur Lai, the founder and the chairman of Chin Tung stockbroking firm; and Stephen Funk, chairman of the First Generation Co which is publicly listed on the Vancouver Stock Exchange.

Cluff Investments and Trading is a member company of the Long-based Cluff Oil Plc. The company has signed two contracts with China to act as the exclusive trading and investment agent for Ningbo and Wenzhou last year.

Cluff Investments and Trading is also an agent for Virgin Records (Boy George and Culture Club) in China.

Chin Tung is one of the top stockbroking firms in Hong Kong and First Generation has raised many stock issues for China-related projects over the years.

First Generation also has a majority stake in a Hong Kong-based company called Welton Electronics which has already set up an electronics factory in Shenzhen.

During a visit to Beijing last week, the trio relayed their plan to senior Chinese officials including Mr Gu Mu, a state councillor; Mr Tian Yinong, vice minister of the Ministry of Finance and Mr Cui Yanxu, vice chairman of the Bank of China board.

"We are very committed to China and we have high hopes of China's development," said Mr Tang. "China has decided not to spend too much money and not to borrow any money because of its restraints in foreign exchange reserve.

"Our plan is to convince China to spend a small amount of money and we can magnify its five times. Since the fund is very big, China has no need to raise funds to finance its projects."

After the U.S.$200 million is raised, a joint venture management company will be set up to manage and invest the fund.

"It is very difficult to get a quick return from investment in construction and manufacturing projects, so the management company will also invest in trading activities to generate a constant cash flow," said Mr Tang.

"It is our hope that China's import and export corporations will also put their money into this fund-raising scheme.

"The management company will provide capital injection into the import and export corporations if it wants to boost its production for export.

"Many products in China can be exported if the production capacity is big enough."

According to Mr Tang, they will continue negotiations with China although the government is very cautious about the scheme.

"If China accepts the plan, we can raise the fund very quickly," he said: "It will be the most revolutionary way of raising funds for China."

BRIEFS

PLANE DEVELOPMENT AGREEMENT WITH FRG--Bonn, Jun 6 (XINHUA)--China and Federal Germany today signed an agreement on cooperation in joint development of a new plane MPC-75 at the Hanover International Air Show. The project was worked out by Federal Germany's largest aerospace company Messerschmitt-Boelkow-Blohm (MBB) and the China Aero-Technology Import and Export Corp (CATIC). It was reported that the two sides have already begun feasibility studies and the first commercial flight of the MPC-75, a 85-120 seat regional passenger plane capable of flying a distance of 2,800 kilometers, could take place in 1995 if design and development work proceeded well as expected. MBB and CATIC also agreed to set up a joint office in Hamburg to coordinate their work and establish contacts with potential customers. "We are both convinced there is worldwide demand for this type of plane," said MBB's chairman Hanns Arnt Vogels. [Text] [Beijing XINHUA in English 0623 GMT 7 Jun 86 OW] /6662

LEASING BUSINESS VOLUME--Beijing, Jun 6 (XINHUA)--Leasing in China is rapidly becoming a major industry with sales in the billions of yuan some five years after the country's first two leasing companies opened. According to a report in today's overseas edition of the PEOPLE'S DAILY, 40 leasing companies are operating in China, including 13 joint ventures using Chinese and foreign capital. The other 27 leasing enterprises are state-owned. Altogether, the paper said, the 40 companies have signed 1,100 leasing contracts in China and overseas worth 800 million U.S. dollars. The companies' range of services has expanded as fast as their business volume, it said, with new offerings including patent licenses, computer software, used industrial equipment and equipment assembled into complete units. Some Chinese leasing outfits have begun competing in the international leasing market, generating needed foreign exchange, the paper reported. The Sino-Japanese China-Orient Leasing Comapny, for example, has leased an 18,000-deadweight ton carrier to a foreign company, it said. The ship was built in Guangdong Province in southeast China. [Text] [Beijing XINHUA in English 0543 GMT 6 Jun 86 OW] /6662

SHANDONG LEAD IN COTTON--Shandong Province, which plans to export 150 million kilograms of cotton this year, now earns more foreign currency from cotton than any other province in China, the newspaper ECONOMIC INFORMATION reported. Contracts for exporting 147 million kilograms of cotton have already been signed, the paper said. China has long been a major cotton exporter to Asia and Eastern Europe and Chinese cotton has always been popular among foreign clients for its variety and different grades. Shandong is one of six cotton export bases in China. Last year, the province exported 82 million kilograms of cotton, 24 per cent of the country's total cotton exports, and earned $105 million in foreign currency. Shandong has improved the quality of its cotton and consequently its reputation in the international market by switching to better varieties, and the paper reported that three varieties produced in the province were now among the best in China. In 1983, the province exported only 6.1 million kilograms of cotton, 4.8 per cent of the country's total. Exports soared in 1985 when the province began to grow better strains in 90 per cent of its cotton producing areas. [Text] [Beijing CHINA DAILY in English 7 Jun 86 p 2 HK] /6662

SPECIAL ECONOMIC ZONES

CURRENT PROBLEMS FACING SHENZHEN SEZ

Hong Kong CHING PAO [THE MIRROR] in Chinese No 1, 10 Jan 86 pp 24-26

[Article: "What Are the Problems Currently Facing Shenzhen? Conversion Between Publisher of CHING PAO and Secretary-General Zhou Erkang"]

[Text] On the afternoon of 9 December 1985, in room 442 of the Overseas Chinese Building in Shenzhen, Mr Xu Simin [1776 0934 3046], publisher of CHING PAO, had a frank discussion with Secretary General Zou Erkang [6760 1422 1660] of the Shenzhen City government about the problems currently facing Shenzhen. Also participating in the conversation were Director Luo Miao [5012 1181] of the SHENZHEN TEQU BAO and Mr Wang Yiming [3769 0001 2494] (a Taiwan businessmen, the sole investor and proprietor of the Cuihu Holiday Village).

Will Issuing "SEZ Currency" Bring Good or Harm?

Xu: At the National People's Political Consultative Conference in 1985, Mr An Zijie [1344 1311 0094] supported issuing "SEZ currency," but Mr Li Zisong [2621 1311 6139] felt that "the more kinds of currency, the more trouble." I support issuing "SEZ currency" on the condition that all other currencies are withdrawn. At first, Prof Qian Jieju [0578 1367 7467] supported issuing it, but recently, after making a study trip to Hong Kong and exchanging opinions with some bankers, he also feels that it needs to be reconsidered. For a period recently, arbitrage in Shenzhen was very prominent, although of course Shenzhen cannot bear the main responsibility. Every day 10,000 to 20,000 Hong Kong and Macao compatriots and 70,000 to 80,000 people from the interior arrive in Shenzhen. There is a considerable element among them engaged in black market currency deals and profiteering. Statistical information shows that in 1984 more than 7 billion yuan of domestic goods were exported to Hong Kong but the actual foreign exchange income was only 5 billion yuan. The more than 2-billion-yuan difference was "washed away" as "goods smuggled across the sea" and black market foreign exchange, or the money made was deposited in Hong Kong.

Zou: Looking at the development of the SEZ, by the end of the century, the city of Shenzhen will need to have brought in gradually about $7 billion in foreign investment. The characteristics of foreign funds are that they can enter and leave freely and fluctuate freely. China's economic system as a whole is turned inward, and the appropriate financial foreign exchange pulicy for this system is: RMB cannot be freely converted into foreign exchange.

We do not care how much foreign currency comes in, but we do control how much goes out. But this policy creates problems for SEZ's, which "focus on importing foreign investment." The more foreign investment there is, the more problems there are. For example, 80 percent of the products of a joint venture are sold overseas and 20 percent are sold domestically. Its raw materials and technology are also imported, paid for with foreign currency. In the past 2 years it has accumulated 7 million yuan in RMB. It is impossible to convert this sum into foreign currency, but the money cannot be used in China either; the money can neither be used or transferred.

Shenzhen is very close to Hong Kong and Macao; fishermen and farmers have trade deals with the outside, and in addition more than 80,000 people from Shenzhen are in Hong Kong. As a result, many Shenzhen residents get their hands on Hong Kong dollars, and with Hong Kong dollars they can buy foreign consumer items. In this situation, for a considerable period of time it will be very difficult to prevent the circulation of Hong Kong dollars. More important, the best we can do at present is to adopt transitional SEZ policies to respond to the importation of large amounts of foreign funds: three kinds of currency (Hong Kong dollars, foreign exchange certificates and RMB) will circulate simultaneously. Enterprises which bring in foreign exchange will not have to convert the foreign exchange. But following the growth of the SEZ, this does not help China politically or economically. Of course, the Hong Kong and Shanghai Bank and Charter Bank welcome the circulation of Hong Kong dollars in Shenzhen; since they issue Hong Kong dollars, this benefits them. But in regard to the national interest and considering the growth of the SEZ, the circulation of three currencies cannot last forever. That is why there is a plan to issue "SEZ currency," uniting the three currencies into one "SEZ currency." But this has been delayed due to a lack of agreement.

Xu: Including Shenzhen, how many hundreds of millions of Hong Kong dollars are estimated to be circulating in the several SEZ's?

Zou: For the first period it was calculated that in the Shenzhen market approximately HK$300 million were circulating while in the books there were still more. In this situation, we only crack down on illegal currency exchanges, such as black market currency deals at the train station.

Xu: In parts of Guangdong and Fujian which are the hometowns of overseas Chinese, some ordinary people specially "convert privately" RMB into Hong Kong dollars and hide them in trunks, thinking that they will keep their value. This is also black marketing.

Zou: We have previously analyzed cases of black marketing foreign currency; 65 percent of them involved people coming from the interior to Shenzhen to buy Hong Kong dollars at high prices and 30 percent involved people from Hong Kong coming to Shenzhen to get their hands on RMB and buy medicine and special local products, which they sold at a profit back in Hong Kong. This means that less than 5 percent of the criminals were actual residents of Shenzhen engaging in illegal sales activities. People talk about how bad all the profiteering in Shenzhen is, but it really is not done by Shenzhen people. Of course, for quite a long period of time, there have been problems of lax management of industrial and commercial administration and ineffectual crackdowns; this fault is already being corrected.

Xu: Aside from the illegal activities already mentioned, Shenzhen also has the problem of state-run units buying and selling things for a negotiated price in foreign exchange.

Zou: The city is now establishing a "Foreign Exchange Regulation Center" which will centrally manage such matters. To sum it up, currency is a complicated problem.

"Providing a Way Out" To Resolve the Currency Problem

Wang: Taiwan gives us a solution. When people enter Shenzhen, they change their money into RMB; foreign currency cannot circulate. When they leave the country, leftover RMB is converted back into foreign currency. Wouldn't that work?

Xu: Hong Kong and Macao compatriots and overseas Chinese have many relatives on the mainland. If someone brings 10,000 yuan into the country, he might spend it all in a month and then leave the country. But his relatives and friends within China might, as is common, collect, 8,000 yuan which he would convert into foreign exchange at the border and take away with him. On paper he has used 2,000 yuan; on the surface it is "legal."

Zou: This is called "arbitrage" it is easy to do but it won't work. (Xu: Black marketing can only be stopped if the official foreign exchange list price does not differ too much from the black market price.) The problem in Shenzhen which most urgently needs a solution is the free entrance and exit of foreign funds after they have been brought in. The original idea was to replace other currencies with convertible "SEZ currency," which could be freely exchanged for foreign currency, American dollars, British pounds, Hong Kong dollars, but not for RMB (Xu: So you still intend to issue "SEZ currency"). In other words, the special policy which "focuses on bringing in foreign funds" requires special financial foreign exchange policies adapted to it. When the former is "special" but the latter is not "special," we cannot do the job right. We are not merely keeping our eye on the market question of those 200 to 300 million; the big question is how best to bring in large amounts of foreign funds, which affects how we can realize the general policies for running SEZ's.

We have already made the currency problem clear to the Central Committee. If we cannot issue "SEZ currency," another good method is fine. We cannot always be debating side issues such as "many currencies cause much trouble"; people are always criticizing the currency mess but they don't come up with feasible solutions. Somehow we have to come up with a solution.

Issuing a kind of currency is always a process. We imagine that in the first stages of issuing "SEZ currency," the central bank can make the effort to support it for a period of time; with economic growth in Shenzhen, it can later gradually let go.

Are the Many "Windows" in Shenzhen Good or Bad

Xu: Recently everyone had been coming to Shenzhen to set up "windows"; is this another factor leading to the confusion?

Zou: In general, it has worked out fairly well for the first rank of administrative in the central government such as the ministries and the first rank of administrative units in the provinces and cities to come set up "windows" in Shenzhen. For example, ministry-run units, such as the Industrial Trade Center, Aihua, and Huaqiang, have played a good role in bringing technology and funds into Shenzhen. The great majority of cases of legal offenses and profiteering have been in units below the prefectural level, especially below the county and commune level, and have been due to lax management. The situation has gotten better during this period of ractification, and after foreign exchange is in balance, it will gradually get on the right track. (Xu: The crux of the matter is still that there are too many "windows.") That is why there is the rectification.

Xu: Too many "windows" creates a serious problem of smuggled goods.

Zou: In fact, the problem of smuggled goods cannot be considered Shenzhen's problem.

Xu: But it is precisely by way of Shenzhen that many smuggled goods flow into Hong Kong and overseas. To give a small example, for the "Dadi" brand shirt sold in Chinese products outlets in Hong Kong, the cost is more than HK$20 and it retails for more than KH$30. On the Shenzhen market it is sold for 7 yuan. When Hong Kong people come to Shenzhen, by changing HK$10 for RMB on the black market, they can buy a "Dadi" brand shirt exactly like that sold in the Hong Kong Chinese product outlets. This means that if Hong Kong people coming to Shenzhen bring back just two "Dadi" brand shirts to Hong Kong, they will have earned the cost of their roundtrip train fare. This is just small-scale personal selling. The serious problem is the "windows" of state-run units crossing the border ever so properly and then attacking the Hong Kong Chinese products market with "smuggled goods."

Zou: The Kowloon customs is directly affiliated with the General Customs Office; the city of Shenzhen has no control. In addition there are the sea routes, which also are not controlled by Shenzhen. In the past there was no permit system for exporting, and no quote system. Now that the question has been raised, a permit system has been established and customs is starting to control things.

Xu: Originally Shenzhen had more than 10,000 people from Hong Kong, Macao and the interior coming in daily. Has this been greatly reduced now?

Zou: This figure refers to festivals and holidays, usually there aren't so many, so now the market is a little depressed. (Xu: Can this kind of depression be considered healthy?) We feel this shouldn't have happened in the first place; the changes in attitude and policy toward the SEZ in the recent period have had an effect. The wait-and-see attitude adopted by many foreign and Hong Kong businessmen toward investing in Shenzhen is a problem. (Xu: Is the decline in the number of people coming in from the interior carrying big bundles of RMB a specific reflection of the causes of depression?) Of course, the less of this the better.

Is the "Second Boundary at Shenzhen" in Effect?

Xu: If the second boundary as originally conceived is put into effect, will Shenzhen become even more depressed?

Zou: ; There is a conflict here. As originally conceived, "two boundaries" would divide the SEZ from the non-SEZ, in order to make the SEZ even more open. Within the first boundary, except for tobacco and liquor, everything would be duty-free, the same as in Hong Kong, and except for drugs, weapons, and pronographic magazines, the border-crossing procedures would be simplified, facilitating people going back and forth. But due to the lagging inability to resolve the currency problem, it has been set aside. We estimate that next year we should be able to gradually implement it; this is being considered as a part of developing overall policies for SEZ's.

Xu: It seems that some areas in the development of Shenzhen over the past few years are the opposite of what was originally envisioned, and that it is necessary to start all over from scratch.

Zou: At the outset we too were unclear about this concept of "SEZ," and only later did we clarify it as something "focusing on bringing in foreign funds, establishing joint ventures and foreign-owned enterprises, selling products overseas, and market regulation." This distinguishes between SEZ's and the interior. At the same time SEZ's serve as four "windows": knowledge, technology, management, and policies toward the outside world. When Premier Zhao came to visit we added the "two radiations," namely, products going out and funds and technology coming in. The role of "four windows and two radiations" is intended to serve the entire four modernizations.

Xu: Could we sum it up as earning foreign exchange: not much outside foreign exchange has been earned, but a lot of China's foreign exchange has flowed out via the "windows." (Zou: We really haven't used much of the state's foreign exchange.)

Zou: Currently all foreign investment enterprises focus on exporting, and do not need any foreign exchange subsidies from the government; every year they hand over foreign exchange to the Shenzhen government.

We don't agree with the idea of changing Shenzhen's form. Before Shenzhen (Bao'an County) became an SEZ, the annual output value from industry and agriculture was only 70 million yuan; the economy was sealed-in and unquestionably was directed inward. In 1980 the SEZ was formed and it started to develop towards the outside. Now, ever year $80 million worth of just agricultural products and byproducts are exported. Although there is a gap between the 40 percent of industrial products sold overseas and the goal of 70 to 80 percent, since we practically started from zero and have gone step by step in opening up to the outside, it isn't a problem of changing the form.

As for the matter of earning money, this is commercial trade of mutual benefit; since Shenzhen is a part of the interior, this kind of commodity exchange relationshp will continue in the future, and it is very difficult to say that one side earns money while the other side loses out.

In the past few years, Shenzhen, acting on its own and with the assistance of the interior, has put a few big buildings, shopping malls and cultural facilities, with the goal of creating a good environment for investment and attract foreign funds. So it isn't simply developing methods for city construction and making the city prosperous.

What Advantages Does Shenzhen Itself Offer?

Zou: Shenzhen still has a "geographical advantage" which the interior can't duplicate: it is very close to Hong Kong and has the advantage in developing the market in fresh goods, such as milk, vegetables, egg products, pork, beef, mutton, live chickens, flowers and plants, etc. The state has called on us to develop this; after being produced in Shenzhen, the goods are very fresh when shipped to Hong Kong and can earn money. Is it economical to transport pigs from Hunan to Hong Kong, or cows and sheep from Nei Monggol? The foreign exchange earned by the interior doing this is relatively low.

Some time ago Hong Kong reacted against the increase in vegetables and fish from Shenzhen. This is mainly because there needs to be reform and adjustment in the assignment of quotas by the Ministry of Foreign Economic Relations and Trade. For example, Shenzhen makes money on raising chickens; before the SEZ was set up, in 1 year it would export 30,000 chickens; now (1985) in 1 year it can produce 10 million chickens but its 1985 quota is 7 million. If chickens are shipped from Heilongjiang to Hong Kong, it doesn't pay. Of course, the original exporting provinces whose foreign exchange incomes are affected by the reduction in exports can receive certain compensation in foreign exchange from Shenzhen by going through the economic and trade system. This way everyone benefits. At present, when we aren't able to make full use of our advantages, the result is that I squeeze you out and you squeeze me out--nobody benefits.

Xu: This is where the problem lies.

Zou: With the big program on Hainan Island, what about Shenzhen? We feel that the biggest difference between Shenzhen and Hainan Island is in the attitude of the governments. The Hainan Island government made a big mistake when it decided to deal in car sales; lower levels imitated their superiors, and it developed beyond the point of no return. The Shenzhen local government has consistently opposed profiteering activities, and every year we have to handle a few such cases. But dealing with these cases doesn't mean that we've put a stop to illicit buying and selling; profiteering is a complex social phenomenon, connected with the commodity-oriented society; it won't go away just because you oppose it. Therefore, for a long time we won't be able to loosen control; we will regularly have to crackdown and deal with it.

Xu: It seems that since rectification and restructuring, the development of Shenzhen is basically sound; we can make this conclusion.

SPECIAL ECONOMIC ZONES

DIRECTION FOR SHENZHEN SEZ DISCUSSED

Hong Kong CHING PAO [THE MIRROR] in Chinese No 1, 10 Jan 86 p 87

[Article by A Gui [7093 2710]: "Which Direction for Shenzhen SEZ?"]

[Text] Shenzhen SEZ is just a speck of land located between Hong Kong and China's interior. The easiest way for it to earn money is to develop as a transfer point for trade and use price differences between domestic and foreign markets. But because to its south is the commercially highly developed Hong Kong and to its north is a protected market, the Shenzhen SEZ economy cannot survive by concentrating on commerce; it can only focus on material production. Furthermore, Shenzhen SEZ only has 327.5 square km and no special natural resources, so there is not much growth potential in primary production (with the exception of fishing). It appears that the only course for economic development in Shenzhen SEZ is growth in and concentration on industry.

However, all Shenzhen SEZ has to offer is cheap land and labor and low tax rates, and the incomplete infrastructure, poorly qualified labor force, difficulty in cooperation among different trades, imperfect law, and low administrative efficiency have all greatly diminished what it has to offer. Bringing in advanced technology involves Shenzhen SEZ's ability to digest and absorb the technology as well as the question of economic results (under certain conditions, advanced technology is not necessarily able to achieve better economic results); more important advanced countries and regions, in order to maintain their own monopoly on technology, cannot export technology without any reservations; we must directly recognize this reality.

We can see that Shenzhen does not really have many options in choosing its path of economic development. What should it develop? How to develop? It is clear for all to see. Policy is forever making its mark on the growth of Shenzhen SEZ, which is indeed the product of policy. But this is really not the same as saying that it is possible to completely rely on subjective will to create a model for economic development; policies in accord with economic laws will greatly promote economic development, and conversely, policies which ignore economic laws will be barriers to economic development or will even lead economic development astray.

The internal and external objective conditions of Shenzhen SEZ show that one-sided emphasis on development of high-level science and technology is not at all the most ideal path. In terms of the stages inherent in economic development, Shenzhen SEZ, at least in the next 10 years, should not make capital- and technology-intensive industry the focus of development but should strive to attract intermediate technology.

Of course, attracting intermediate technology does not rule out introducing things from developed countries and regions, but more important yet is the exploitation of China's technical potential in every field. In the several decades of development since the war, China's technology has already reached a considerable level, and in many areas we rank among the first in the world. There is no harm in our considering primary use of Chinese technology, with the addition of Western science and management and the Hong Kong people's business flexibility, as the special characteristic of enterprises in Shenzhen SEZ. Compared to the total adoption of Western practices or Hong Kong method, this may better help enterprises in Shenzhen SEZ to survive and develop in the fiercely competitive environment of the international market.

Of course, in the long run, only high-level science and technology and technology-intensive enterprises can represent the future of Shenzhen SEZ; the period of transition from being labor-intensive to technology-intensive requires a gradually changing process. Therefore, from now on, when possible we should actively consider bringing in some advanced technology; we should not rely on just one method.

SHENZHEN SURVEY SHOWS ECONOMIC PROGRESS

HK190900 Hong Kong SOUTH CHINA MORNING POST in English 19 May 86 p 9

[Article by Albert Chan, Ophelia Suen, and Julina Chan]

[Text] People in the Shenzhen special economic zone are seeking out Western-style brand name goods and costly electrical appliances.

Fast food, fashionable clothing and costly household appliances have also become common in the pioneer economic zone.

According to a survey conducted by the JOURNAL OF TECHNOLOGY INTRODUCTION, a bimonthly magazine published in Shenzhen, most households now have up-to-date appliances such as colour television sets, refrigerators, washing machines, radio cassette recorders and hi-fis. Electric fans are also popular.

The survey was conducted with a sample of 100 households last year and the results were published in the last issue of the magazine.

They survey found that Shenzhen residents have switched their diet from staple foods to high nutrient, low fat, high protein food.

Other major survey finds were:

Average number of members per household: 4.07.

Average number of members working per household: 2.28.

Average monthly income per household member: 161.26 yuan (about HK$403.15).

Proportion of income derived from salary: 86.9 percent.

Porportion of income derived from bonuses: 17.2 percent [figures as published]

Average monthly consumption per household member on food: 70.88 yuan (about HK$177.20).

Proportion of staple food in total food consumption: 11.4 percent.

Proportion of other food in total food consumption: 80.8 percent.

Tobacco, alcohol and tea in total food consumption: 7.8 percent.

Number of colour TV sets per 100 households: 80.

Number of black-and-white TV sets per 100 households: 26.

Number of refrigerators per 100 households: 69.

Number of washing machines per 100 households: 69.

Number of radio cassette recorders per 100 households: 72.

Number of electric fans per 100 households: 213.

Number of bicycles per 100 households: 168.

Number of watches per 100 households: 289.

Number of cameras per 100 households: 25.

Monthly expenditure per household member on clothing: 12.27 yuan (about HK$30.68).

REPORT EXAMINES PREPARATIONS FOR SHENZHEN AIRPORT

HK040344 Hong Kong SOUTH CHINA MORNING POST (BUSINESS POST) in English 4 Jun 86 p 1

[Article by Olivia Sin]

[Text] Shenzhen has begun preparations for the construction of a long-awaited airport even though the project has not yet been formally approved, according to the city's vice-mayor, Mr Zhou Xiwu.

Speaking after yesterday's ceremony to mark the official release of the feasibility study on the airport, Mr Zhou said a company, Shenzhen Airport Corp. will be set up in the special economic zone soon to draw up detailed plans for the airport.

The preparatory work began after Shenzhen's Mayor Li Hao visited Beijing last month to lobby state planners' support for the airport project.

Mr Zhou said Mr Li reported to various departments under the State Council on the feasibility of building an airport in the special economic zone and "pushed" for its realisation.

"The message brought back by Mr Li is that leading officials from the various organisations under the State Council have agreed that Shenzhen can start preparatory work on the airport even though the project is not yet formally approved," said Mr Zhou.

He could not say when the green light for the project will be given. "I hope it will come as soon as possible."

Before Mr Li was appointed mayor of Shenzhen last year, he was deputy secretary-general of the State Council and is said to have "friends" in various key departments under the council.

But observers yesterday cautioned the preparatory work may prove futile if the project failed to get Beijing's blessing.

Mr Zhou, who heads the Shenzhen International Airport Feasibility Research Unit, said the preparatory work includes land acquisition and airport design.

The latter is being done by officials from the Civil Aviation Administration of China (CAAC).

The airport, if approved, will be built in western Shenzhen in the area known as Huangtian, about 30 km from the city centre.

The SOUTH CHINA MORNING POST had earlier reported that senior Shenzhen officials went to Beijing last month to lobby for financial support from central leaders.

Although Beijing has verbally approved the airport proposal, the project is yet to be included in China's Seventh 5-Year Plan (1986-90).

According to the study report, the official nod is necessary to obtain state funds, which will account for half of the total expenditure, estimated at 1.47 billion yuan (HK$3.67 billion), for building the airport in three stages.

The study said the granting of state funds will help lower the construction costs by eliminating the need to shoulder heavy interest payments.

According to the study, the ideal financing method would be for the government to provide half of the 1.47 billion yuan, with the remainder raised by loans in both yuan and foreign currency.

Breaking down the financial requirement for the project, the study said the airport may require about 200 million yuan worth of foreign exchange and 150 million yuan in state subsidy by 1990.

The requirement for funds will rise to 525 million yuan in state subsidy and 225 million yuan in foreign exchange by the year 2000.

The study said the developers can raise foreign exchange by floating a bond or raising loans and/or forming joint ventures.

Mr Zhou said initially, approval is being sought to build the first phase, which will cost 200 million yuan.

Depending on future needs, the special economic zone will pally for permission to build the other two stages.

The study, including detailed financial and technical evaluations of the project's three stages, was completed in February and presented to the State Council.

According to the study, the first stage will see the construction of a single 2,800 m long and 60 m wide runway to accommodate Boeing 737, MD-82 and Trident planes.

On completion of the first stage, the airport will be able to handle 1.2 million passengers a year and 50,000 tons of cargo.

The first phase can be completed in three years. If work began in the last quarter of this year, it could be completed by 1989, said Mr Zhou.

The study said expenditure on the first stage construction will be partly in yuan and partly in foreign exchange.

It admitted that there will be a shortfall in foreign exchange after the first stage opens since most of the revenue will be in yuan, generated by domestic flights.

But more foreign exchange earnings will be generated when the airport is upgraded to international status after the completion of the other two stages and begins serving foreign airlines.

Second stage construction will see the runway extended to 3,400 m to accommodate bigger planes like Boeing 747s and the airport's handling capacity increased to five million passengers and 200,000 tons of cargo a year.

A second 3,400 m long runway will be built in the third stage to facilitate higher passenger and cargo flow.

The US$800,000 study was financed by a grant from the U.S. Government's Trade and Development Programme.

It was jointly conducted by two U.S. firms, Lockheed Air Terminal and Parsons International, Hong Kong-based China Everbest Development Corp. and the Airport Consulting Engineers under the CAAC.

Lockheed's manager for international airport operations, Mr Robert White said the study has highlighted the feasibility of building the airport by suggesting it will bring economic benefits to the special economic zone and the whole of southern China.

"China needs a major air transportation gateway in southern provinces," Mr White said at the ceremony.

He said caution is needed in the actual implementation of the project.

"The feasibility study emphasises proper coordination in planning and implementing a cost-effective airport development programme," he said.

"Unless all the elements regarding design, construction, financing...are coordinated properly, the results of the feasibility study will become invalid."

BRIEFS

NEW LAWS FOR FOREIGN FINANCE COMPANIES--Hong Kong, Jun 5 (AFP)--China is considering passing new laws to govern the activities of foreign finance firms in the country's special economic zones, a Chinese banking official said. Luo Xianrong, general manager of the Shenzhen branch of the People's Bank of China, told reporters in Shenzhen Wednesday that new laws are being considered following a request by a five-party joint venture finance company for a merchant banking license. The Shenzhen branch of the Bank of China, China's central bank, and four foreign firms--U.S.-based Security Pacific Corp., Hong Kong-based Bank of East Asia and Sumitomo Bank and Nomura Securities Co. of Japan--are all partners in the proposed joint venture. Mr Luo said existing legislation regulating the activities of foreign banks and joint venture banks did not cover finance companies. He said the proposed finance company would be governed by existing law on foreign bank branches until new laws are passed. A Nomura Securities Co. spokesman here told AGENCE FRANCE-PRESSE that the company was still studying whether the proposal was feasible. [Text] [Hong Kong AFP in English 0707 GMT 5 Jun 86 HK] /6662

PAPER ASSESSES CHANGES IN WEST'S LABOR MOVEMENT

HK310840 Beijing GUANGMING RIBAO in Chinese 19 May 86 p 3

[Article by Mei Dai [2734 1486], An Miao [2174 5379], and Ma Zifu [7456 1311 1381]: "The New Technological Revolution and the Labor Movement in the West" --passages within slantines published in boldface]

[Text] This year marks the 100th anniversary of the "1 May" International Labor Day--the festival of all proletarians throughout the world. On this occasion, it is definitely necessary to examine carefully, the new features embodied in the development of the international labor movement in light of the new development trends of the world. The new technological revolution is one of the new trends which have emerged in the world today. Having profound influence on the labor movement in developed capitalist countries, it has presented many major theoretical and practical issues. Here we would like to briefly analyze some of these issues.

/First, the structure of the proletariat has changed, obviously, but the class has never "vanished."/ In Western capitalist countries, economic development and the extensive application of new scientific and technological achievements to the production sectors have given rise to changes in the industrial structure and, consequently, changes in the structure of the proletariat. Workers in traditional industries have decreased while those in new industries increased; workers in primary and secondary industries have decreased while those in tertiary industry increased; and blue-collar workers have generally decreased while white-collar workers have increased rapidly--they now make up more than half the total number of workers in some countries. Some people hold that white-collar workers who mainly engage in mental work cannot be counted as a part of the working class; and that neither administrative personnel who are governing and supervising the workers nor scientific and technological personnel who do not directly engage in material production which creates surplus value can be regarded as members of the working class either. Therefore, the decrease in the number of blue-collar workers means that the ranks of workers are shrinking and the working class is "vanishing." This is not a scientific viewpoint. In the wake of the increasing weight of the intellectual factor in production and the further socialization of the production process, the definition of productive workers inevitably has to be expanded--in other words, white-collar workers engaging in technical work, administration, and service trades also fall in the category of the working class. This is because they in general do not own any production means but earn a living by selling their labor. They take part in the creation of surplus value as other workers do and are also exploited by capitalists, thus they should of course be classified as the "mental labor proletariat." For the above reason, the decrease in the number of blue-collar workers and the increase in the number of white-collar workers do not mean the working class is shrinking and "vanishing" but rather indicate that the class is growing and the intellectual standard of the whole working class is being enhanced--great progress in the process of the working class' self-improvement. A parallel case is that the workers' class status remained unchanged when the emergence of the era of large-scale mechanized industries meant substantial progress in terms of both the form of labor and the quality of the working class as compared with the era of workshop handicraft industries.

/Second, although the livelihood of the workers has been improved, the proletariat has not "merged" into capitalism./ In the face of strong pressure from the labor movement, the monopoly capitalist class changed its traditional labor policy featuring starvation and forced labor and began to implement the so-called "social welfare policy" after the War, with a view to temporarily mitigating the contradictions between classes. So, on the surface, the workers' wages were raised, social security and social welfare were improved, and working hours were shortened; in the meantime, the workers' involvement in part of the enterprise's administration has become a rather common practice, and so on. This is a new feature of the labor-capital relations in contemporary capitalist countries. Therefore, some bourgeois thinkers believe that "the proletariat has merged into capitalism," the class "has been bourgeoisified," and the workers and capitalists no longer have conflicts of class interests between them but have become partners on an equal footing. Such a viewpoint is just untenable. In fact, neither the changes resulting from the new technological revolution nor the changes in the monopoly capitalist class/ labor policy has manged to, or could possibly iron out the ultimate confrontation between the proletariat and the bourgeoisie. Although the workers' livelihood has been improved, their real income growth rate is much lower than that of labor productivity and surplus value. The workers have to face the severe challenge of high inflation rate, high tax rate, high unemployment, and high incidence of "occupational diseases as by products of modern industrial civilization" that follow the pay raise. To be sure, the workers' partial involvement in the enterprise's management and administration is a result of the long-term struggle of the labor movement, but it also reflects an objective demand arising from modern socialized production, indicating that the bourgeoisie has been forced to pay more attention to man's initiative in the production process because the role of the intellectual factor and the position of the workers as the main production force have been upgraded. Besides, the scope of involvement in administration and decisionmaking and the relevant power are limited, and the final decisionmaking power is still kept in the hands of monopoly consortiums. Trade unions should make good use of the workers' opportunities of partial involvement in management to forces capitalists to make more concessions, fight for more rights and interests for the workers, and thus enhance their ideological understanding and management skill.

/Third, the labor movement is now facing a tough situation in Western capitalist countries, but a new high tide is bound to arrive./ Due to the influence of the new technological revolution, the development of capitalism in a peaceful environment after the War, and the partial changes in the bourgeoisie's labor policy, the labor movement in the West has encountered some new circumstances and new issues and is facing a tough situation. For example, the membership of trade unions in some countries has dropped, the proportion of organized workers has decreased, strikes and struggle have been weakened, more doubts about Marxism have surfaced, and so on. Some people even interpret the current low tide as the liquidation of the labor movement. In distorting the nature and the social effects of the new technological revolution, they assert that the new technolgocial revolution will present a new way out for capitalism. This is a theory which suggests that technology decides everything. Marxists have always attached great importance to the role of science and technology and believe that they are giant levers to propel the society forward. But they categorically disagree with the theory that technology decides everything. To be sure, the new technological revolution will expedite the growth of the productive forces and, as a natural result, give rise to great changes in social life. However, it will by no means eventually solve the intrinsic contradiction of the capitalist system, namely, the contradiction between the socializationof production and the private ownership of production means, but rather aggravate it and thus make the changes in the relations of production and in the superstructure inevitable. It will be an unrealistic illusion if one thinks that there is no need to wage the proletarian revolutionary struggle whether in violent or non-violent form and that the new technological revolution will naturally eliminate the shortcomings of capitalism or will merge capitalism and socialism into a single whole. Since the invention of the steam mill in the past did not naturally bring forth a capitalist society from within the feudalist society, the growth in the productive forces today can only lead to changes in the production relations rather than substitute for these changes.

In order to push the international labor movement ahead, we badly need to display originality in applying the basic principles of Marxism, and to thoroughly study and interpret in a scientific way the new phenomena and special characteristics of the development of capitalism as well as the social effects of the new technological revolution, in light of the current specific circumstances in various countries. In such a way Marxism will be strongly attractive and convincing to the vast number of workers and will show its great vitality. Today, the communist parties and workers' parties in developed capitalist countries are searching for the road to revolution that will fit their own countries' conditions. More and more labor movement organizers have changed their traditional forms of struggle and their old work style in accordance with the changes in the bourgeoisie's labor policy; and, to cope with the changed situation, they have also introduced new forms and strategies of struggle and adopted new work style. They are bound to overcome the temporary difficulties that they are currently facing, gain more new experience, and win major new victories. After all, the low tide of the labor movement in these countries will pass and a new high tide will follow. Any wavering and pessimistic thinking is completely groundless.

GOVERNOR YOUDE VIEWS TRADE GAP WITH JAPAN

OW271648 Beijing XINHUA in English 1500 GMT 27 May 86

[Text] Hong Kong, May 27 (XINHUA)--Hong Kong Governor Edward Youde conveyed on Monday to Japan the "deep concern" over the great difficulty of obtaining entry for Hong Kong products into the Japanese market.

Addressing the ninth joint session of the Hong Kong-Japan and Japan-Hong Kong business co-operation committees in Tokyo, the governor said that the value of the bilateral trade had increased by 67 percent in the past five years to over 8.1 billion U.S. dollars in 1985. But the trade gap had widened from the ratio of 10 to one in 1983 to 12 to one in 1985.

Earlier yesterday, Hong Kong Committee Chairman S.Y. Chung disclosed that Hong Kong was the fifth largest market for the Japanese products and had the third largest trade deficit with Japan after the U.S. and the Chinese mainland in 1985.

Youde said that Hong Kong could now act as a base for off-shore manufacturing operations involving higher technology rather than simply as a base for assembly work.

He urged Japanese manufacturers to invest in the metals, light engineering and plastics industries which has good export prospects as well as in the electronic firms which enjoyed a ready local clientele.

Referring to measures for alleviating the severe trade imbalance, Youde said that Japan could speed up the establishment of off-shore manufacturing processes in Hong Kong.

Sales of these products back to Japan should help narrow the trade gap while it would be profitable for the Japanese investors and consumers.

He also suggested Japan lower tariff rates for items of interest to Hong Kong.

HONG KONG

TALKS CONCLUDED WITH PRC ON SHIPPING REGISTER

HK200541 Hong Kong SOUTH CHINA MORNING POST in English 20 Jun 86 p 2

[Report from Beijing by Chris Yeung]

[Text] An autonomous shipping register to be set up in Hong Kong before 1997 should be able to continue operating smoothly after China resumes sovereignty of the territory.

This is a consensus view of the British and Chinese experts under the Sino-British Joint Liaison Group (JLC) during discussions on the register which ended in Beijing yesterday.

Both sides will soon report to leaders of the JLG, which will discuss the matter further in its fourth round of talks in London next month.

It is understood that Britain has compiled a proposal for such a setup and raised it during the two-day talks.

A British team member, Hong Kong Director of Marine Y. Y. Chan, said: "We have made good progress and there has been better understanding on the issue."

He said there were still technical problems unresolved, but he was optimistic that the outstanding issues could be ironed out soon.

The Sino-British Joint Declaration states that the Hong Kong Special Administrative Region shall be authorised by China to maintain a shipping register. Certificates should be issued under its own legislation in the name of Hong Kong, China.

An autonomous register will secure a greater representation of Hong Kong in international shipping affairs.

Mr Chan said: "We have agreed in principle that the shipping register should begin operation before 1997 and beyond."

British team leader, Mr C. A. Higginson, deputy secretary for economic services of the Hong Kong Government, will return to the territory this morning.

At the same time, nationality experts from both sides will begin talks today on the format of a new identity card and related issues.

The British side, which arrived in Beijing yesterday, will brief the Chinese authorities on proposed amendments to Hong Kong's Immigration Ordinance and Registration of Persons Ordinance, which aim to give legal power to the term "right of abode."

The term is to be printed on new identities to be issued in Hong Kong from the middle of next year.
